August 19, 2015

Kay Alison Wilkie
Director for International Policy
Division of Business Advocacy and Research
Empire State Development | NYS Department of Economic Development
625 Broadway
Albany, NY 12245

Dear Ms. Wilkie:

The 2014 average unemployment rate for census tract 245 in Queens County that contains the address, 64-06 Queens Blvd., Queens, NY 11377, as you requested is 9.6 percent. The current minimum threshold to qualify as a Targeted Employment Area is 9.3 percent.

2010 census tract boundaries, 2013 American Community Survey five-year estimate labor force data, and 2014 annual average Local Area Unemployment Statistics (LAUS) data were used in this estimate. These data were ACS-shared as described by the U.S. Bureau of Labor Statistics in LAUS Technical Memorandum No. S-13-17.

Please feel free to contact me if you have any questions.

Sincerely,

Joseph Nardone

Circular 230 Disclosure

Pursuant to U.S. Internal Revenue Service Circular 230, the statements set forth herein with respect to Federal Tax Issues, as defined below, were not intended nor written to be used, and such statements cannot be used by any taxpayer for the purpose of avoiding any penalties that may be imposed on the taxpayer under the U.S. Internal Revenue Code. Such statements were written to support the marketing of the LLC or matters addressed herein. It is possible that additional issues may exist that would affect the federal tax treatment of an investment in the LLC and the statements contained herein do not consider or provide any conclusions with respect to such additional issues. Each taxpayer should seek advice based on the taxpayer's particular circumstances from an independent tax advisor. A "Federal Tax Issue" is a question concerning the federal tax treatment of any item of income, gain, loss, deduction or credit, the existence or absence of a taxable transfer of property, or the value of property for purposes of any tax imposed by or pursuant to the U.S. Internal Revenue Code.

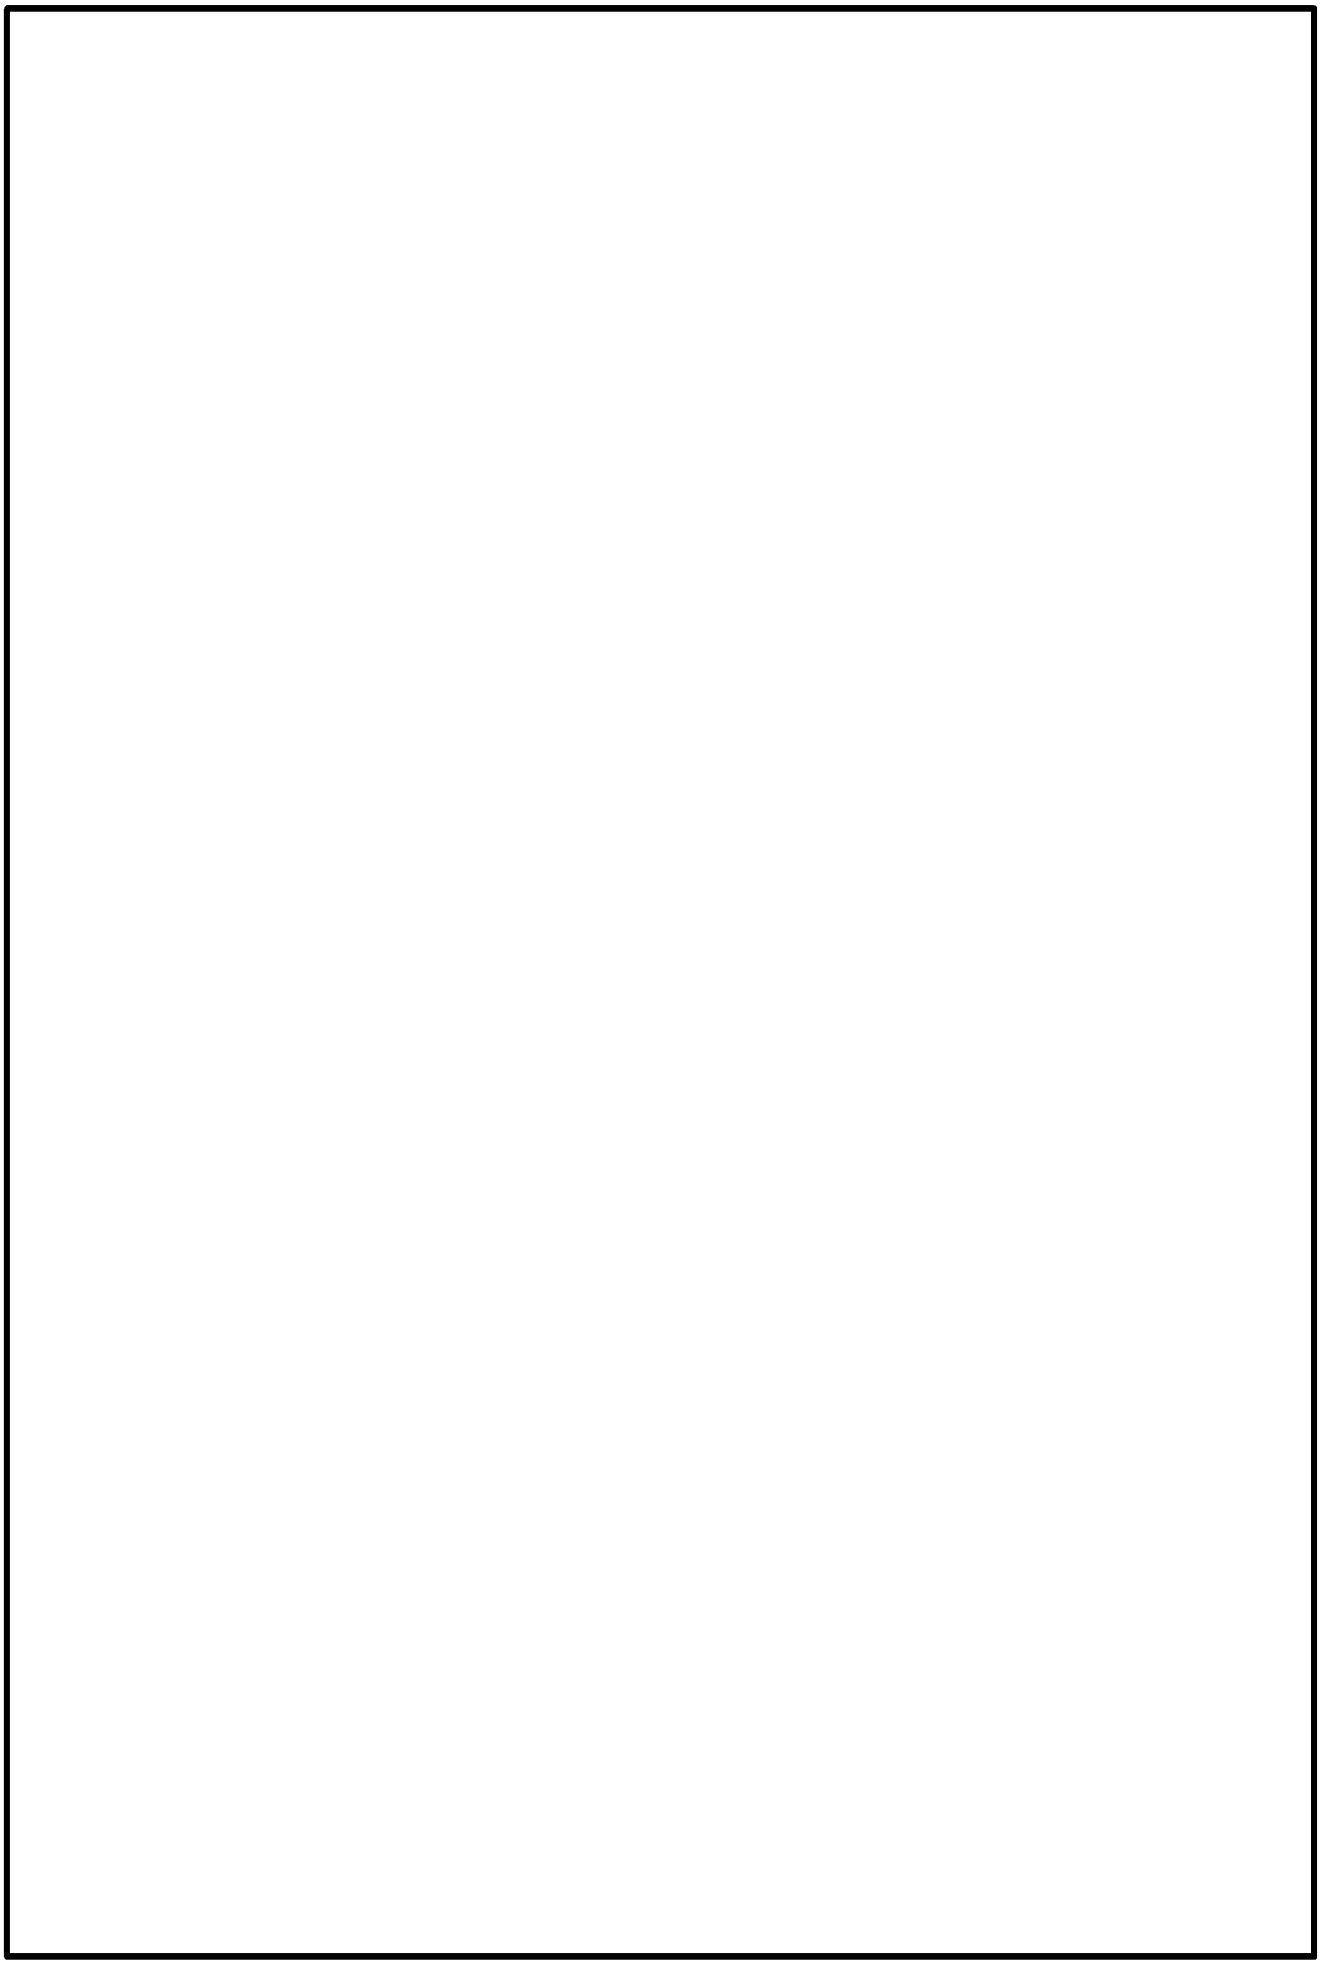
SUMMARY OF OFFERING TERMS

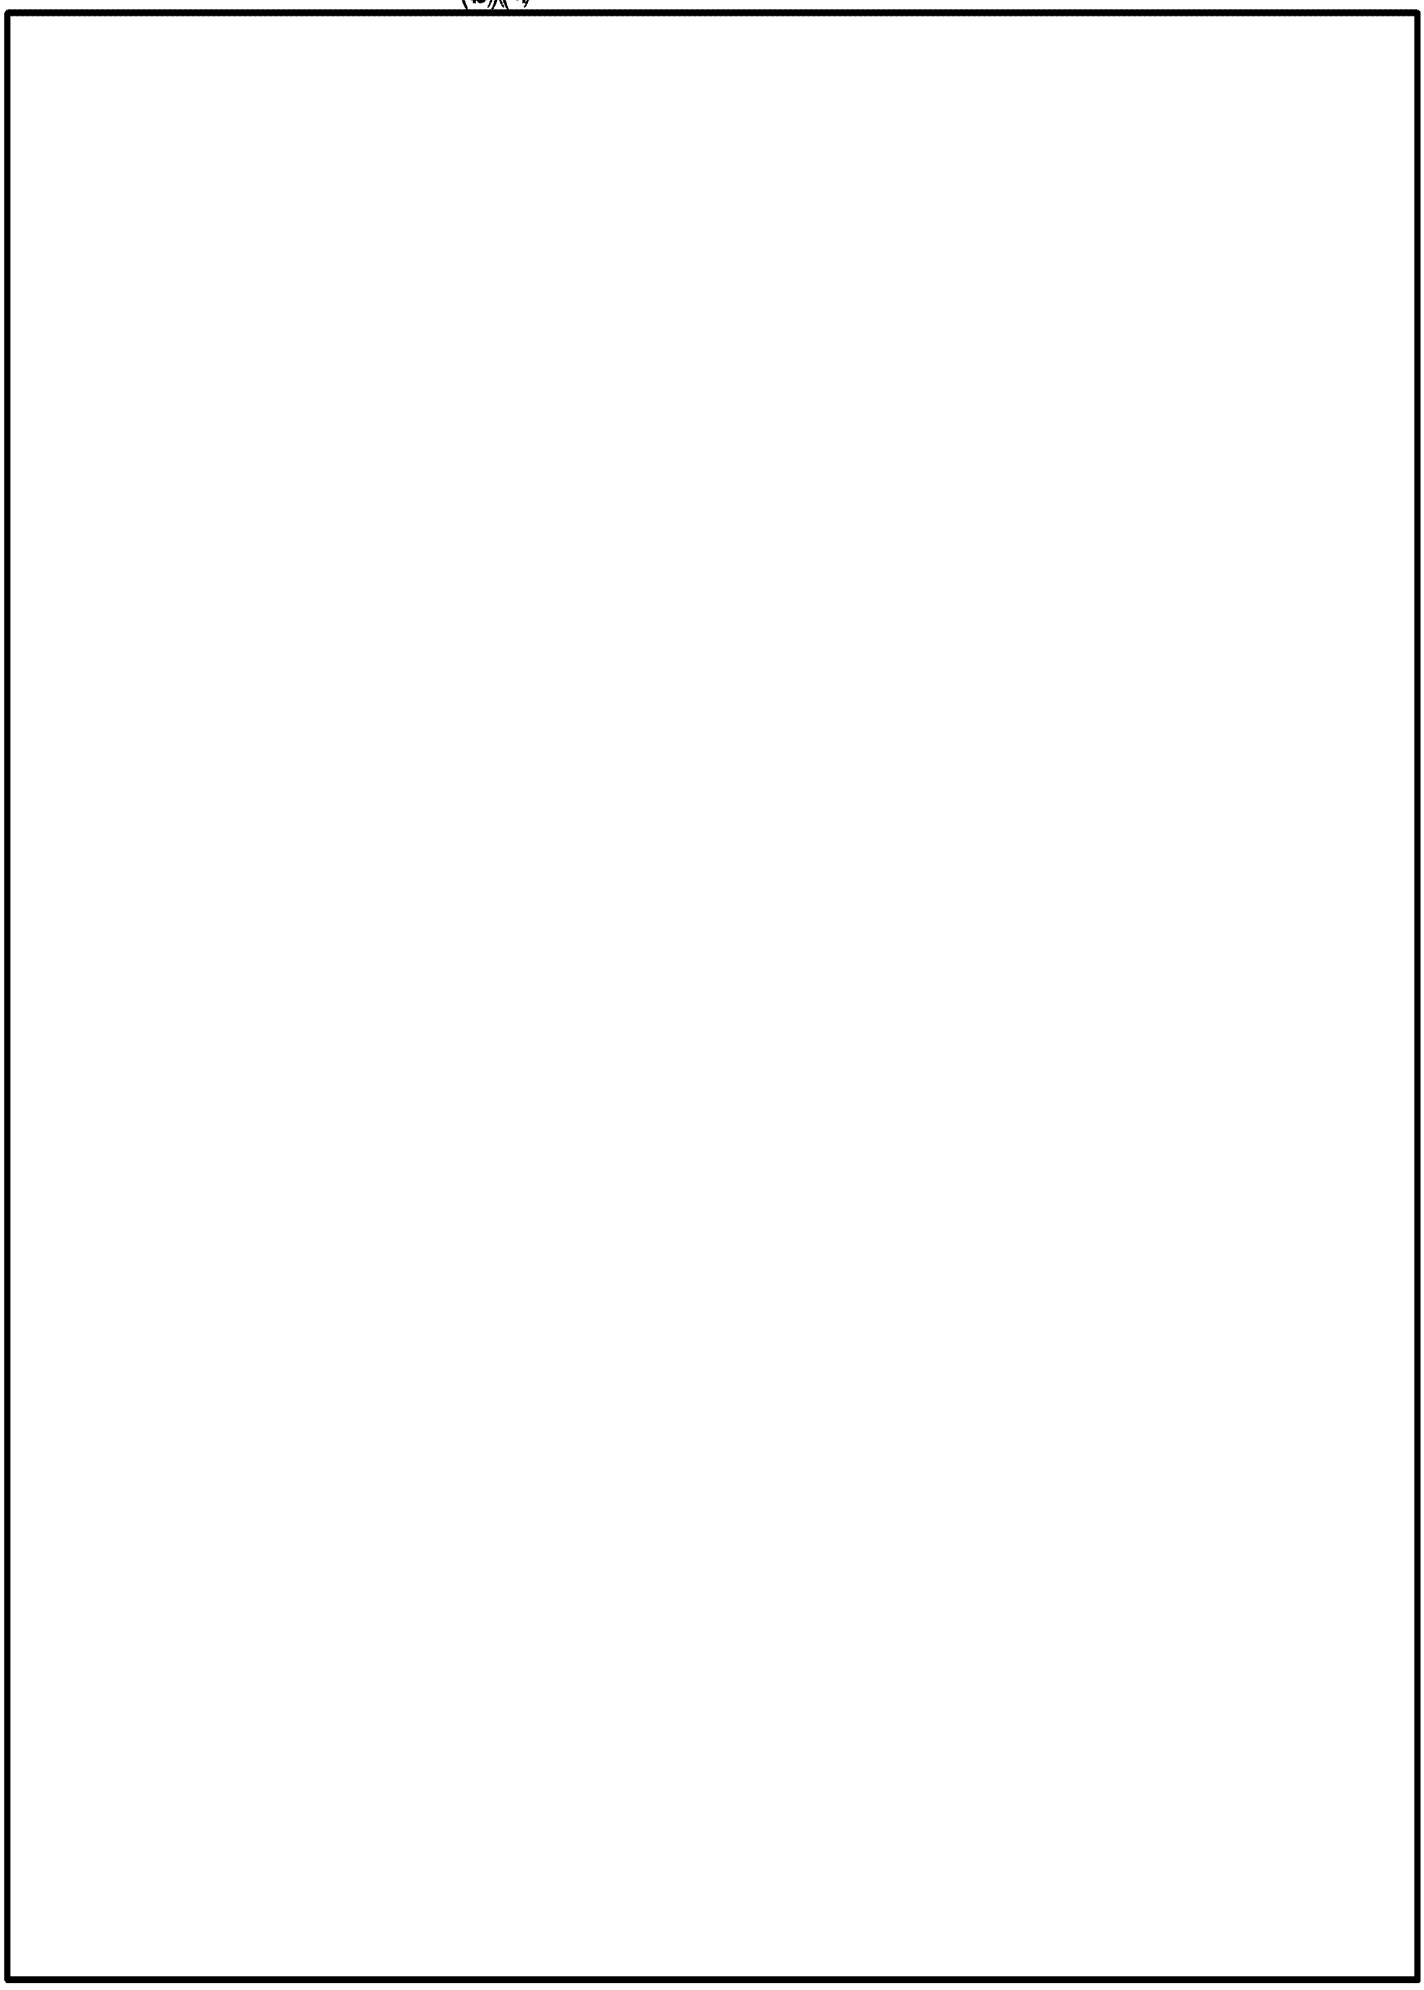
The following is only a summary of certain of the information contained in this Memorandum, and is qualified in its entirety by reference to the more detailed discussions contained in this Memorandum below, as well as to the Exhibits hereto (all of which are incorporated fully herein by this reference). In the case of any conflict between the summary, below, and the more detailed discussion in the body of the Memorandum, the latter shall control. Similarly, this Memorandum, its exhibits, and certain other documents related thereto have been initially written in the English language; in the event of any conflict between the original English versions and any translations into other languages, the former shall control. (b)(4)

The plan is to construct and develop a Holiday Inn Express & Suites (the "Project") in New York City.

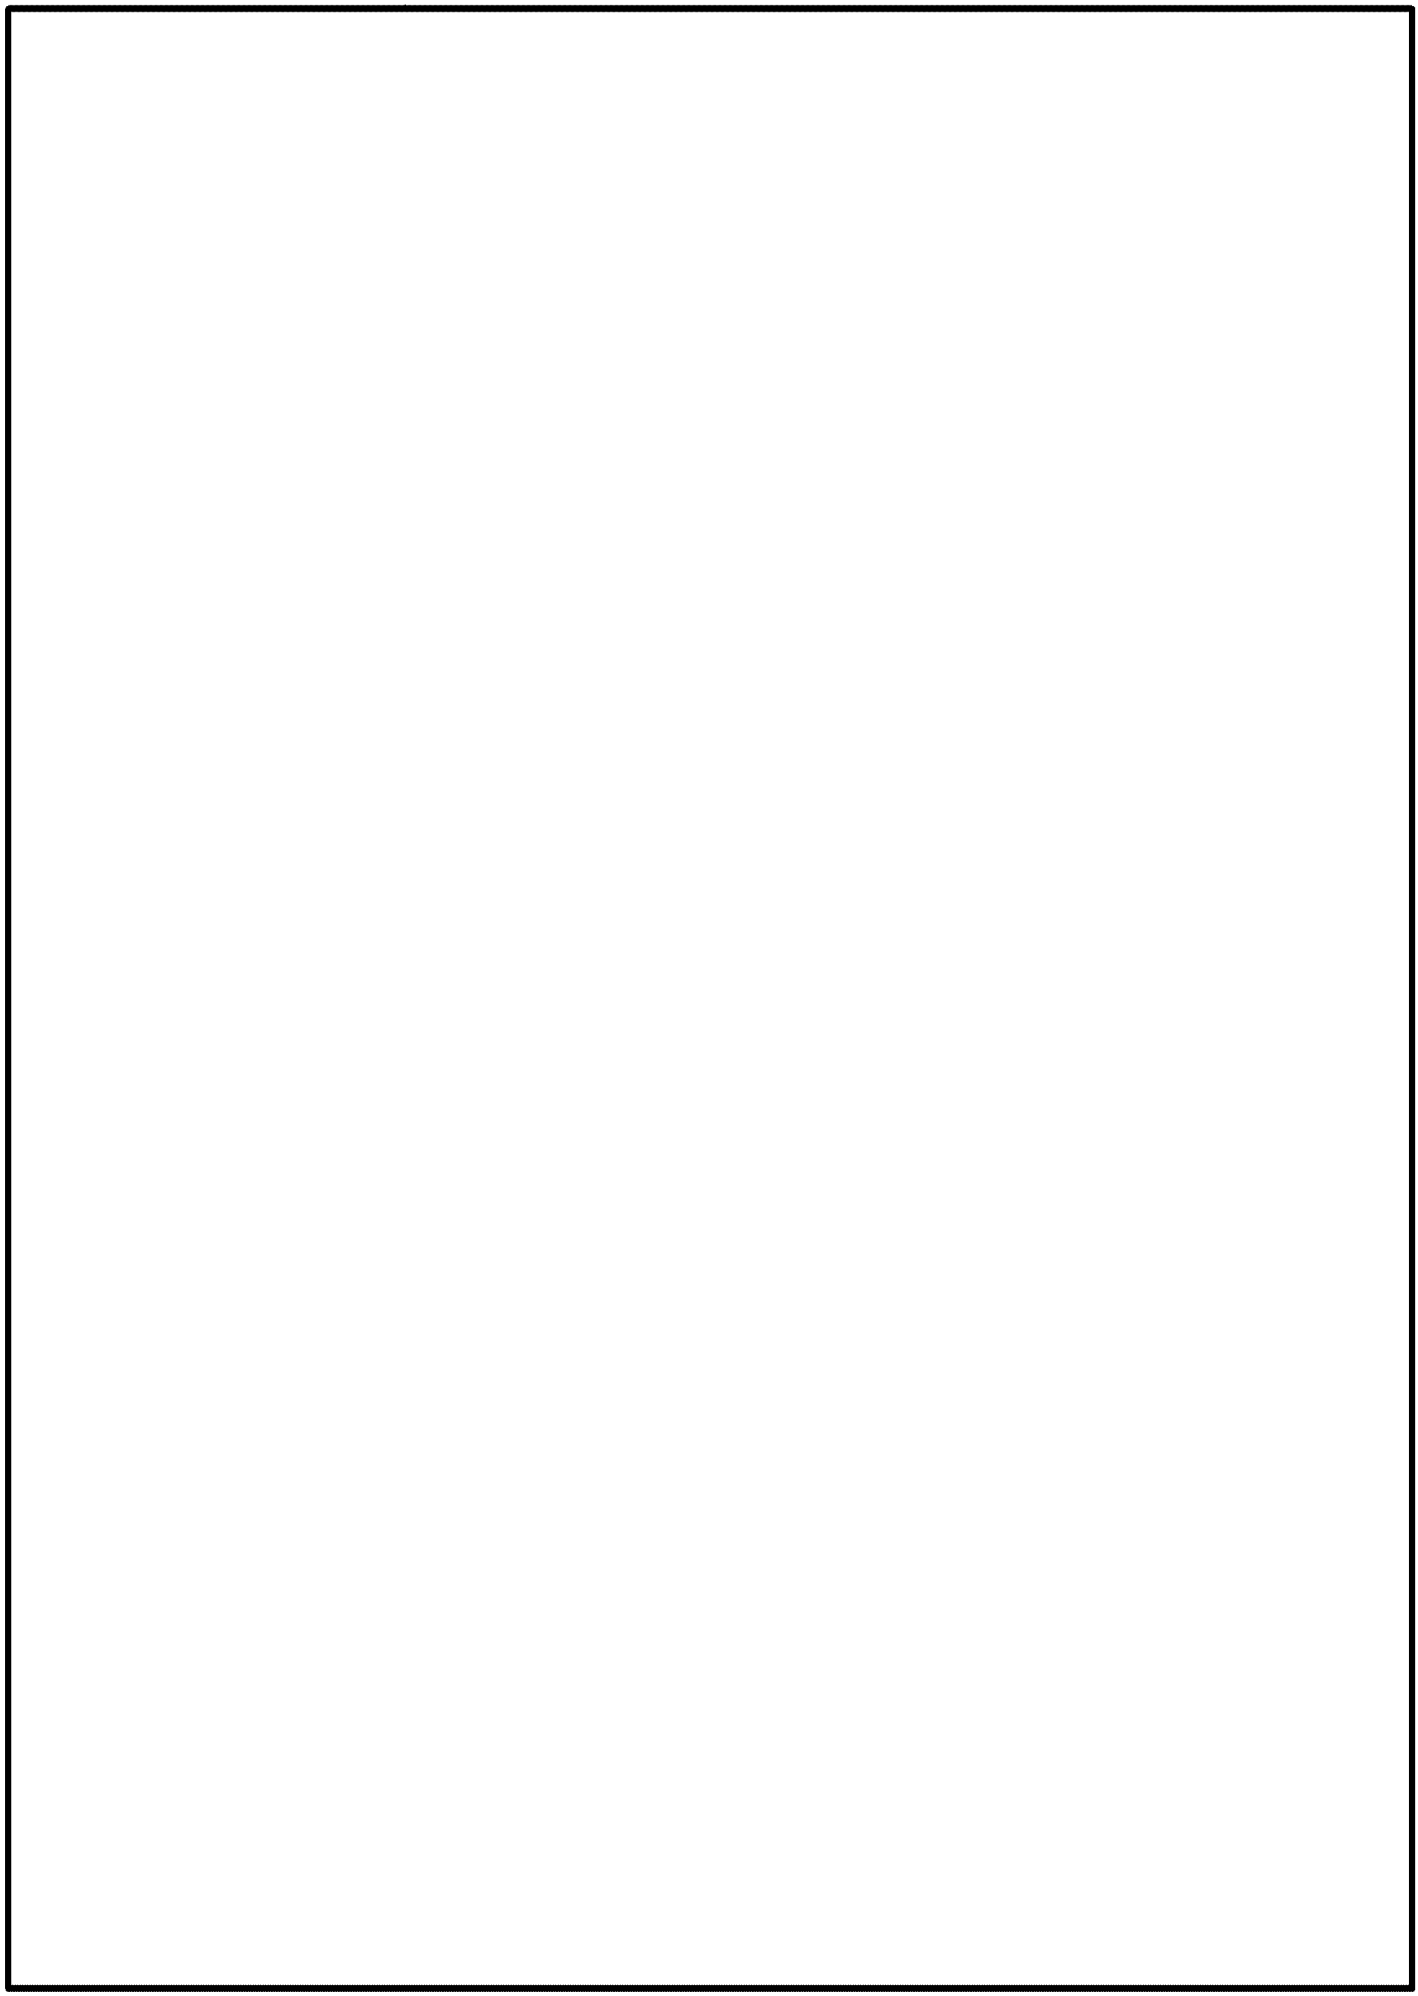
(b)(4)

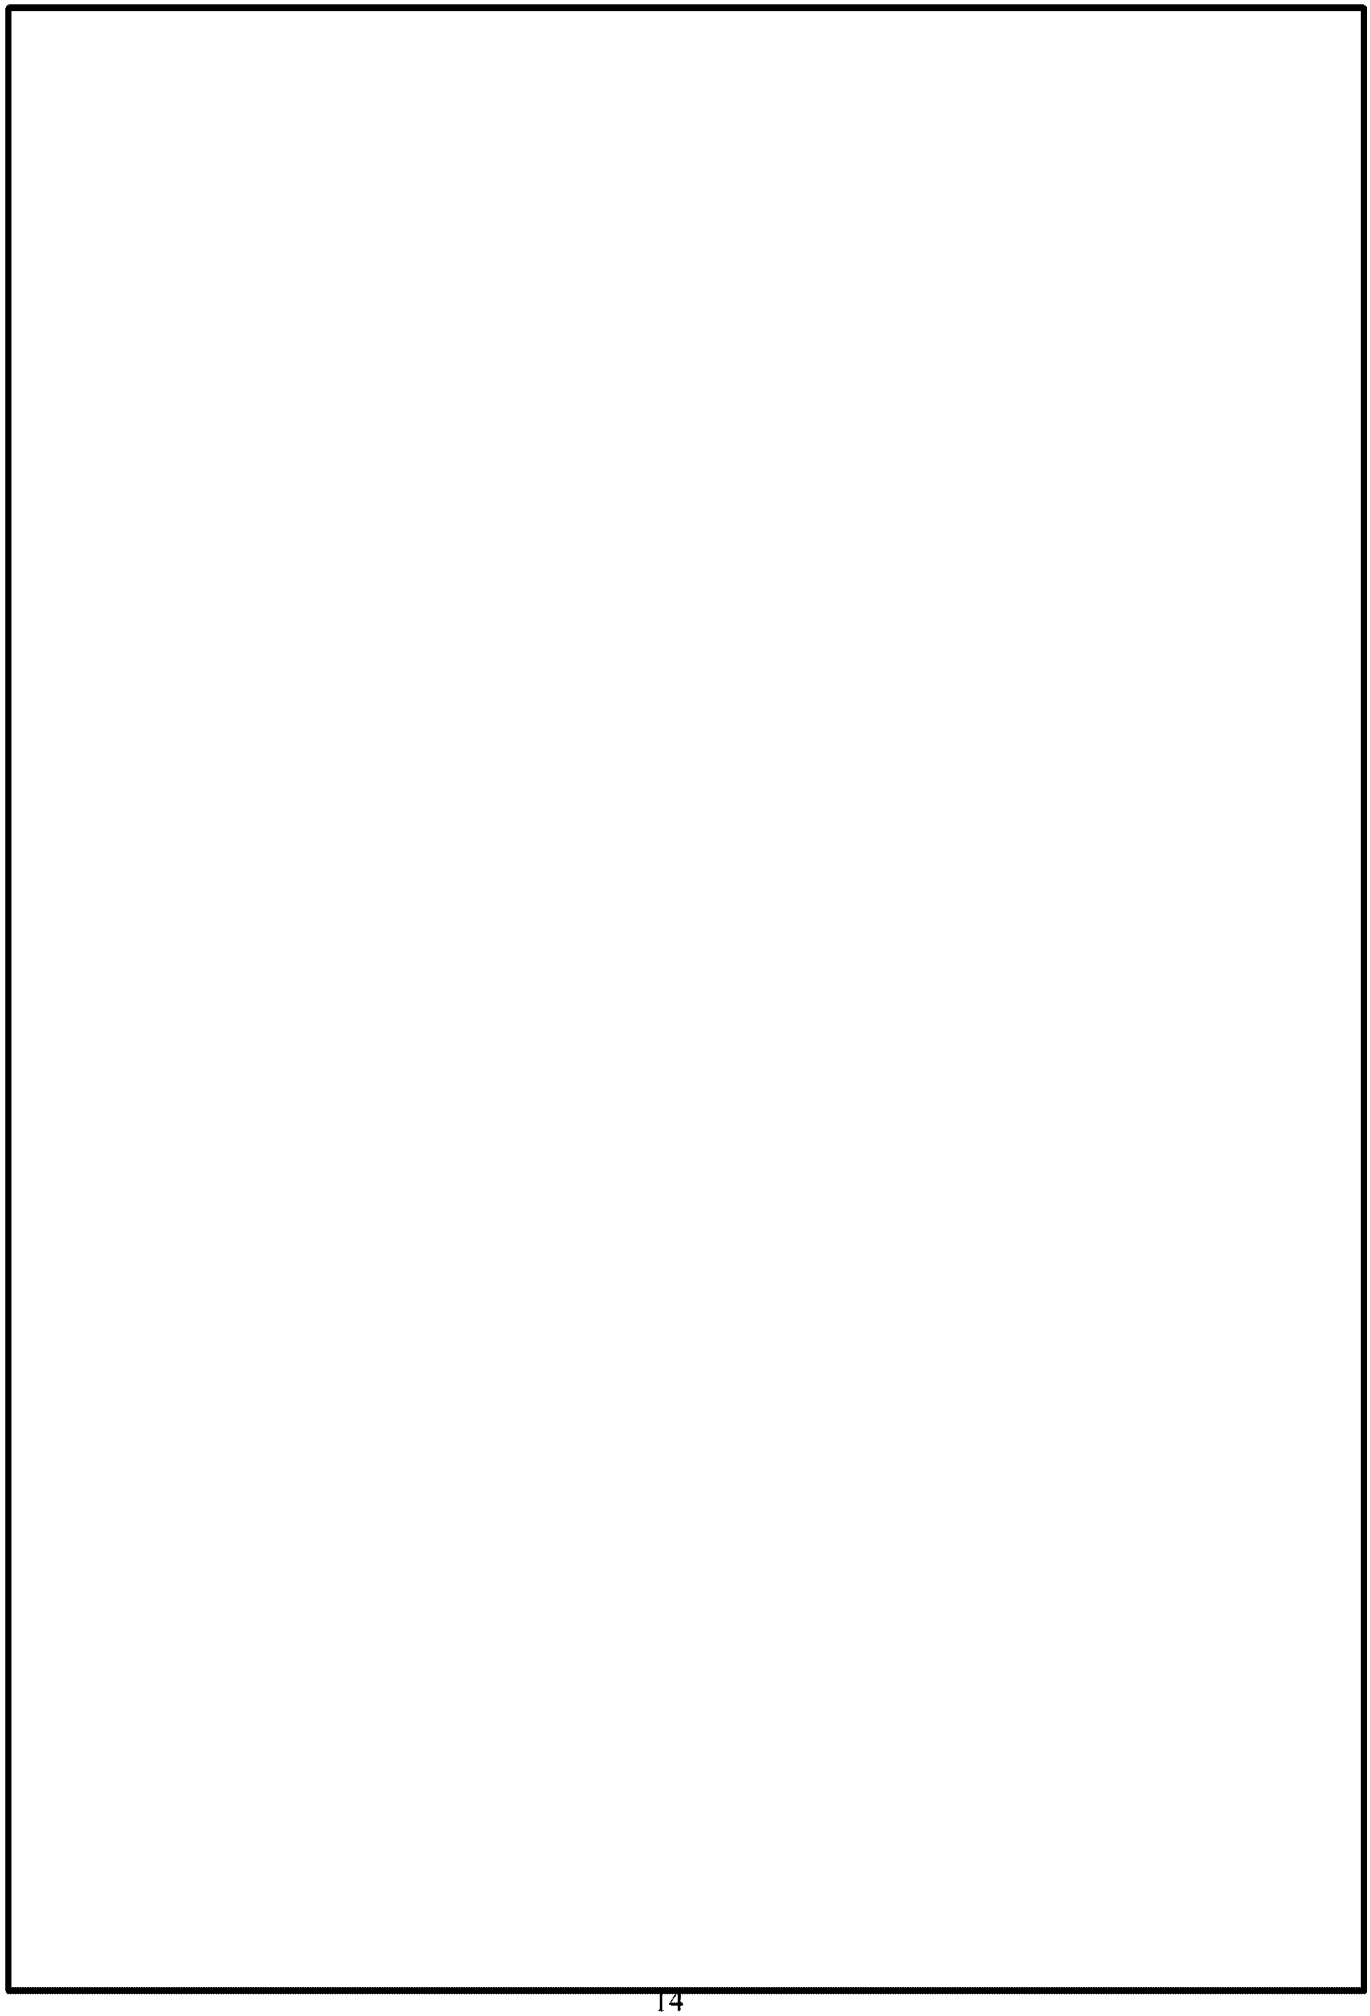


(b)(4)



(b)(4)





(b)(4)

* * * * *

DESCRIPTION OF THE BUSINESS

BUSINESS OVERVIEW

The Holiday Inn Express & Suites is located in Woodside, Queens in New York City. The project site is located at 64-06 Queens Blvd in Woodside, NY 11377. The New York State Department of Labor designated the area where the Project is located as a Targeted Employment Area ("TEA") as of August 20, 2015. See TEA Designation Letter in Exhibit F. The proposed Holiday Inn Express & Suites is a hotel building which consists of a 135-room and suites hotel. The Project is seeking to raise a maximum of $8 million in investor capital from 16 EB-5 investors for the EB-5 Immigrant Investor Program (hereinafter "EB-5") for the The Holiday Inn Express & Suites hotel in New York City.

The Holiday Inn Express & Suites EB-5 Project entails a new construction of a hotel building which consists of a 135-room hotel in Woodside, Queens, one of the five boroughs of New York City. The Holiday Inn Express & Suites is an upper-midscale, limited-service hotel brand by InterContinental Hotels Group (IHG), offering a full-service hotel experience at a reasonable price. The construction and operation of the regional base of invested capital, the creation of new jobs, and the associated economic growth effects will be put into effect with the capital raised from immigrant investors through the EB-5 Program.

TARGETED EMPLOYMENT AREA AND $500,000 INVESTMENT

The project is located at 64-06 Queens Blvd in Woodside, New York 11377. The location is in census tract 245 in Queens County. The New York State Department of Labor designated the area where the Project is located as a TEA as of August 20, 2015. As of the date of this Memorandum, the minimum Capital Contribution of $500,000 equals the minimum investment that must be made by an investor into a job creating project located in a targeted employment area seeking a visa under the EB-5 Program.

THE EB-5 PROGRAM AND JOB CREATION

The EB-5 Program provides lawful permanent resident status in the United States to foreign investors who, among other things, make qualifying investments under the provisions of the relevant immigration law, 8 U.S.C. §1153 (b)(5)(A) - (D); Immigration and Nationality Act § 203 (B)(5)(A) - (D) (the "Immigration Act"). To obtain the benefit of lawful permanent resident status in the United States under the EB-5 Program, a foreign investor must, among other things, make a qualified investment, such as an investment in the Company, into a new commercial enterprise and comply with the requisite immigration procedures (see "Immigration Matters" on page 60 for a summary of immigration procedures). Pursuant to the Immigration Act, a qualified immigrant investor must invest (a) an amount of at least $1 million or (b) if made in a "targeted employment area" (defined as a rural location or an area of high unemployment which is at least 150% of the national average), then in an amount of at least $500,000. August 20, 2015, the New York State Department of Labor certified the area encompassing the Project as a high unemployment area, therefore qualifying it as "targeted employment area". See Exhibit E attached hereto.

The Regional Center was designated as a "regional center" on May 14, 2015. The benefit of achieving "regional center" status is that any project that is both sponsored by the Regional Center and satisfies certain other EB-5 Program criteria may count indirect or induced (as opposed to only direct) jobs towards satisfying the job creation requirements of the EB-5 Program. The EB-5 Program requires that the Company create at least 10 full-time jobs for each investor admitted as a Member in connection with this Offering. The Company believes that it will create, directly and/or indirectly, a sufficient number of jobs to satisfy the employment requirements of the EB-5 Program for all Members. However, investors must be aware that there are numerous other factors that could lead to the grant or denial of an EB-5 immigrant visa based upon the job creating performance of the Project as well as on the personal facts and circumstances of each investor.

The Company engaged Evans, Carroll & Associates, Inc. ("ECA") to analyze the economic and job creation impacts of the participation in the construction and operations phases of the Project and to prepare an economic impact report (the "Economic Impact Report").

(b)(4)

The analysis prepared by ECA used the Regional Input Output Modeling System for calculating job creation by the Project. According to the analysis, ECA estimates that the likely job impacts from the Company's participation in the Project will be [redacted] new jobs generated, which, assuming full subscription, equates to [redacted] jobs per Member, above the USCIS-required 10 jobs per Member.

The qualifying jobs created by the Offering proceeds shall be allocated to the Investors on a first-in, first-out basis tied to the later date on which both of the following shall have occurred: (a) the LLC has accepted an Investor's subscription, and (b) the Investor's Capital Contribution and Administrative Fee have been released to the LLC or deposited into escrow. This allocation process will continue until all jobs have been allocated to the Members.

Below is a table summarizing the employment and revenue estimes from the Economic Impact Report.

Table A. Summary of Employment and Revenue Estimates

Activity	Exp/Rev mil cur $	Exp/Rev mil 2010 $	RIMS II Mult	Total Jobs	Direct Jobs
Hard construction costs	[redacted]	[redacted]	13.2149	[redacted]	[redacted]

All figures based on unrounded numbers

* Indirect and induced jobs only

ORGANIZATIONAL STRUCTURE

QB Ventures EB5 Capital, LLC will be the new commercial enterprise, (hereinafter the "NCE") a newly formed entity for the purpose of raising EB-5 investment capital. Queens Blvd Ventures LLC is the job creating entity (hereinafter "JCE") which owns and operates the project. The NCE will be managed by Century New York City Regional Center, LLC (hereinafter the "Manager" or the "RC"). The NCE will lend the funds to JCE. The NCE is managed by RC. Mr. George Xu is the owner and principal of RC and JCE.

TARGET MARKET (b)(4)

The Project, the Holiday Inn Express & Suites, is located in Woodside, New York. Located in the Woodside district of New York City's Queens Borough, the site is readily accessible to a variety of local, county, state, and interstate highways. Major interstates, such as Interstates 278, 495, and 95, connect Woodside to other major cities – New Haven, Connecticut; Philadelphia, Pennsylvania; not mention its close proximity to Manhattan, New York. Transportation to Manhattan, the commercial center of New York City, may be easily accomplished via the Long Island Expressway, the Grand Central Parkway, the New York City Subway, and the Long Island Rail Road. Guests will have access to the hotel on Queens Blvd., between 64th Street and 65th Street. The project's location is in a commercially active area in Woodside.

In 2014, New York City was estimated to have accommodated roughly 56 million visitors. New York City maintains its ranking as the number one U.S. destination for overseas travelers, hailing roughly 12 million from

international markets. According to most market observers, such levels could not been realized without the expanded availability of hotel rooms in New York City.

COMPLETION GUARANTEE

The principal of the Developer, George Xu has entered into a construction guarantee. Under the terms of the construction guarantee, George Xu has guaranteed that the Project will be completed in accordance with the term of the loan agreement between the Company and the JCE, and to indemnify the Company for any damages resulting from the failure of the Project to be completed in accordance with the terms of the loan agreement.

BRANDING AND PROJECT HIGHLIGHTS

Branding:

Holiday Inn Express (and Holiday Inn Express Hotel & Suites) is an upper-midscale, limited-service hotel brand by InterContinental Hotels Group (IHG). According to IHG, Holiday Inn Express is one of the fastest growing hotel brands in its segment. Holiday Inn Express offers competitive rates for both business and leisure travelers. All locations provide the complimentary "Express Start" breakfast bar, and many locations offer recreational amenities such as a swimming pool and/or fitness room. As of year-end 2014, there were 2,060 properties spanning 182,601 rooms in the Americas. In 2014, Holiday Inn Express hotels operated at an average occupancy rate of 68.5%, with an average daily rate of $108.48 and an average RevPAR of $74.26 in the Americas.

Project Highlights:

- Close proximity to Manhattan, New York
- Proximity to Flushing Main Street, major commercial and residential areas with high concentrations of Chinese and Korean population
- Proximity to two major airports in New York City
- Holiday Inn Express, an upper-midscale hotel brand offering a full-service hotel experience at a sensible price
- Century Construction Group is an established developer in NY
- 135-rooms

(b)(4)

USE OF PROCEEDS

The total cost of the Project is estimated at [redacted] consisting of, consisting of land costs of approximately [redacted] hard construction costs of approximately [redacted] and soft and other costs of approximately [redacted] The owner's equity is [redacted] which is approximately [redacted] of the development costs. The maximum raise of EB-5 investment funds will be [redacted]

The EB-5 investment funds raised will be in amount up to [redacted] to construct and develop the Holiday Inn Express & Suites. The project developers already have traditional bank financing in place for the remainder of the financing. Thus, intermediary short-term bridge financing may used to complete the construction. EB-5 investment may be used to replace a bridge loan from other commercial lenders. As necessary, the JCE may also provide temporary short-term bridge financing through member loans in order to commence construction and create jobs in advance of EB-5 funding.

Below are the construction budgets and the projections:

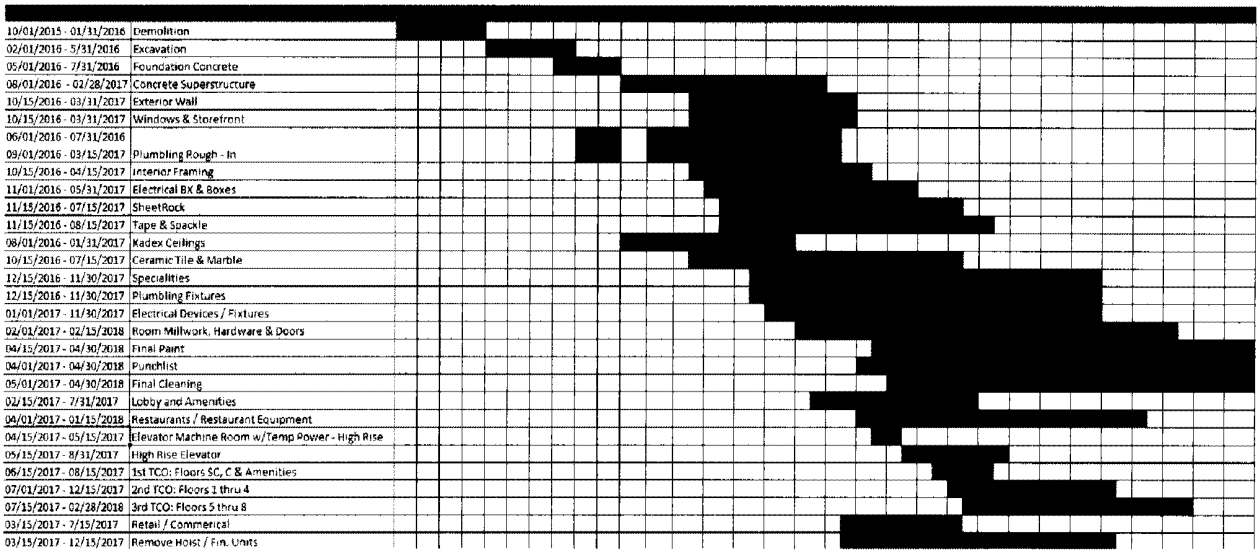
CONSTRUCTION OF THE PROJECT

The construction of the Holiday Inn Express & Suites project will take approximately 27 months to complete. The developer already has obtained the architectural designs, fabrications, excavations, and procurement and will apply for all necessary permit and licenses in place. The actual construction is expected to begin in the near future. The timeline at provides the particulars of the various phases of the construction over a period of project months from the commencement of the construction. For example, the early months will consist of the excavation and necessary foundation work.

The construction of the Holiday Inn Express & Suites project will take approximately 27-months to complete starting with excavation. The demolition phase of the project is scheduled to begin in October of 2015. The construction timeline is presented below.



The developer has obtained all necessary permits and licenses to begin construction and development of the project. Construction is expected to begin in October of 2015, and it is anticipated to be completed by mid-2018.

CONSTRUCTION PERMITS AND LICENSES

In New York City the construction is "as of-right" development which complies with all applicable zoning regulations and does not require any discretionary action (special permit or variance) by the City Planning Commission or Board of Standards and Appeals for approval. Assuming that the project complies with all other Code and Zoning regulations, the NYC Department of Buildings Plan Examiner Plan Examiner will approve the Plans, further to the architect's construction detailed blueprints and renditions.

It is not necessary for the project to seek the additional approvals of the City Planning Commission, or of the Local Community Board, or of any other outside party of interest. If the project complies with the applicable Zoning Laws currently in force, the developer is entitled to build.

MANAGEMENT BIOGRAPHIES AND INTERRELATIONS

The following paragraphs set forth the Officers of the Issuer and its Manager.

The amounts and percentage of Units beneficially owned are reported on the basis of regulations of the SEC governing the determination of beneficial ownership of securities. Under the rules of the SEC, a person is deemed to be a "beneficial owner" of a security if that person has or shares "voting power," which includes the power to vote or to direct the voting of such security, or "investment power," which includes the power to dispose of or to direct the disposition of such security. A person is also deemed to be a beneficial owner of any securities of which that person has a right to acquire beneficial ownership within 60 days. Under these rules, more than one person may be deemed a beneficial owner of the same securities and a person may be deemed a beneficial owner of securities as to which he has no economic interest.

MANAGEMENT BIOGRAPHIES

Mr. George Xu, CEO/Regional Center Principal

George Xu is the founder and a principal of the Century New York City Regional Center ("CNYCRC"). Mr. Xu is also the founder and the President of Century Development Group, a real estate development company based in New York City. With nearly 20 years of real estate holding and development experience, he has worked on over a million square feet of real estate developments; mixed-use developments including residential, hospitality, office, and retail. He has also worked in all phases of assembly, acquisition, finance, design, construction, marketing, and sales. Mr. Xu's projects have involved close collaboration with the City of New York, as well as the State of New York on issues including zoning, land use, and environmental matters, and he provides marketing oversight and policy guidance for the Regional Center's operations. Mr. Xu holds a Bachelor of Science degree in Electrical Engineering and Computer Science and a Master of Science degree in Computer Science from Polytechnic University, New York.

Qili Li, MD, Regional Center Principal

Qili Li, MD, FACOG, is a principal of CNYCRC. Dr. Li has been in private practice for more than 15 years specializing in the field of Obstetrics and Gynecology in downtown Flushing, Queens County, New York City. Dr. Li attended the Sophie Davis School of Biomedical Education. She graduated Magna Cum Laude. After receiving her Medical Doctor degree from New York Medical College, Dr.Li completed her internship and residency training in Obstetrics/Gynecology at North Shore University Hospital at Manhasset, New York. Dr.Li is board certified in the specialty of Obstetrics/Gynecology. She is also a fellow of the American College of Obstetrics/Gyneoclogy (ACOG). In recent years, Dr. Li has expanded her interest/investment into real estate. She is currently involved in several real estate development projects ranging from high end condominiums to hotel construction.

David Pan, Vice President

David Pan is a vice president of CNYCRC. He has over 15 years of experience in fixed-income securities trading and risk management. Mr. Pan has worked in various roles at Credit Suisse, Citigroup, Deutsche Bank and the hedge fund industry. Formerly a Director at Credit Suisse in the Strategic Risk Management division covering Residential Mortgage Backed Security (RMBS) business, he was instrumental in developing models and methodologies in assessing the firm's risk exposure to the mortgage security market. Prior to his Wall Street career, Mr. Pan spent 10 years as a senior software engineer responsible for the development of the state-of-the-art fixed-income security trading and analytics software systems. He graduated with a Bachelor's degree in Computer Science from Queens College, City University of New York.

James Ho, Vice President

James Ho is a vice president of CNYCRC. Mr. Ho's role in the CNYCRC is to provide oversight of operations, maintain cohesion between the project's developer, general contractor, law and accounting firms, and to ensure overall compliance. Mr. Ho has extensive experience in computer programming, securities trading, and security related business. Currently, he is involved in real estate development of several projects in the New York City area. Mr. Ho graduated from Polytechnic University with a major in Electrical Engineering and Computer Science.

Robert Chen Vice President

Robert Chen is a vice president of CNYCRC, and oversees the overall operations of the Regional Center. He's also in charge of due diligence and evaluating potential projects and determining business feasibilities. Prior to joining CNYCRC, Mr. Chen had over 10 years' experience in a senior management position with FedEx. He has owned, managed, and operated companies in computer wholesale and repair business. Mr. Chen received his Bachelor of Science degree in Environmental Health Science from City University of New York.

Anthea Quan, Accounting Controller

Anthea Quan serves as the director of accounting controller for CNYCRC. She is responsible for the accounting, financial reporting, and audit functions. Ms. Quan also performs management of operating cash flow and financial analysis for development projects and investor distribution. She is passionate about accounting and has experience working with a variety of small businesses. Ms. Quan graduated from Yanbian University in China with a bachelor of mathematics. She is fluent in Chinese, English and Korean. She currently resides in New York City with her husband.

Tracy Law, Director of Project Management

Tracy Law is the director of project management of CNYCRC. Ms. Law is responsible for a full spectrum of the operation to ensure projects are done on time and within budget. Her constant communication with contractors and architects provides a strong network of relationships in the field. She is responsible for supervising and coordinating OS&E and FF&E. She is integral in bringing new hotels to full operation. Ms. Law graduated with a Bachelor of Science degree in Accounting from Queens College, City University of New York.

Lynn Wei, Director of Marketing and Business Development

Lynn Wei is CNYCRC's director of marketing and business development. Ms. Wei is responsible for a full spectrum of business development initiatives including creating and overseeing international marketing strategies for all CNYCRC project offerings. She is also involved in managing client relations. Ms. Wei is also a senior business development associate at the Century Development Group. In this capacity, she focuses on creating Request for Proposals and general marketing materials, as well as developing a customer analytical database, and implementing strategic marketing and communication initiatives. Ms. Wei graduated with a Master of Science degree in Economics from Brooklyn College, City University of New York and a Bachelor of Administrative Degree in Marketing from Shanghai Finance University.

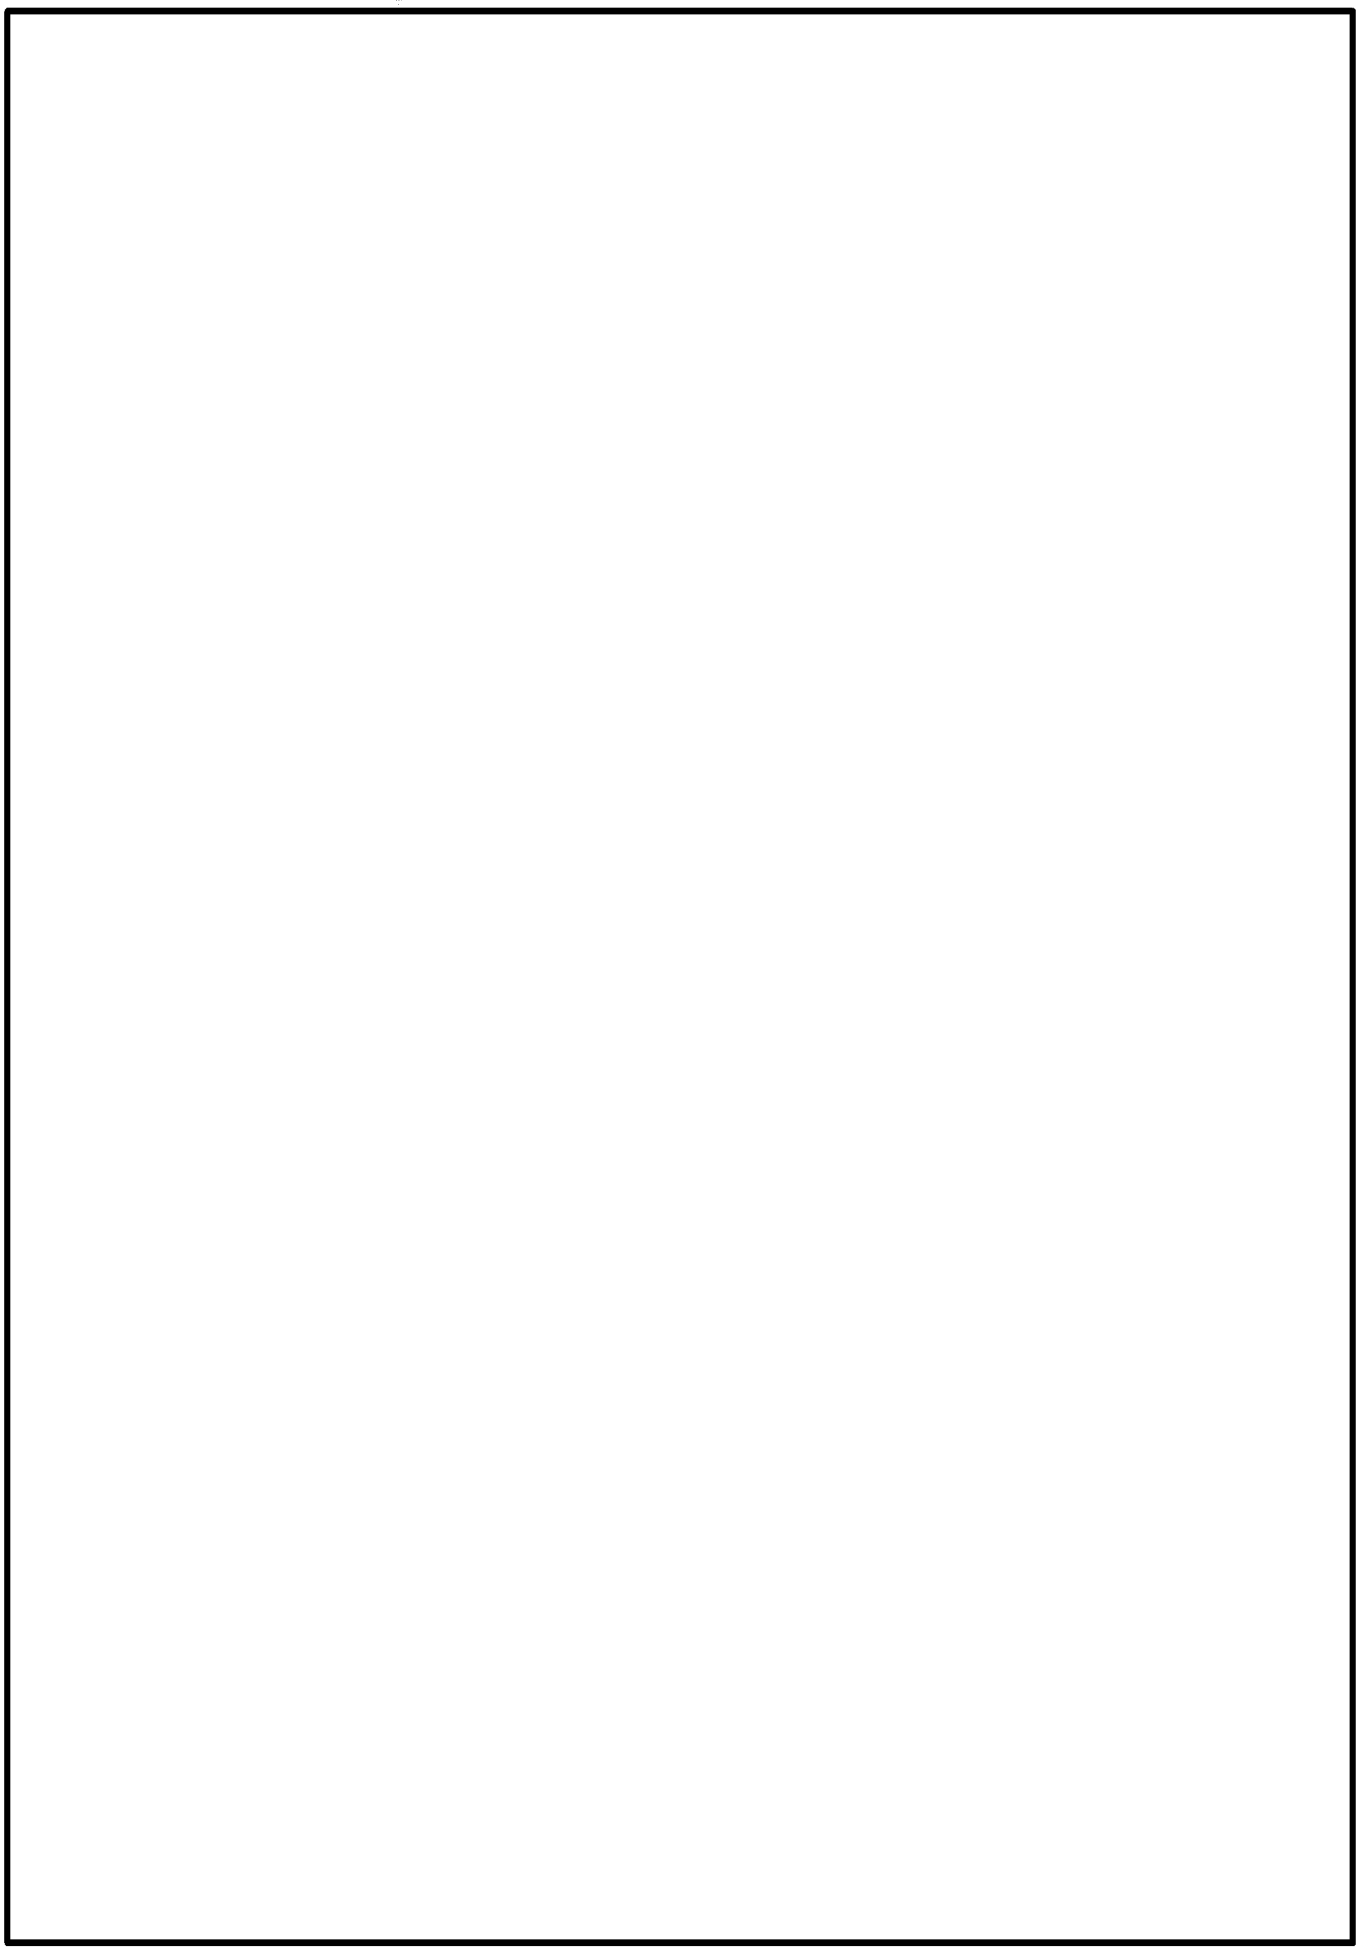
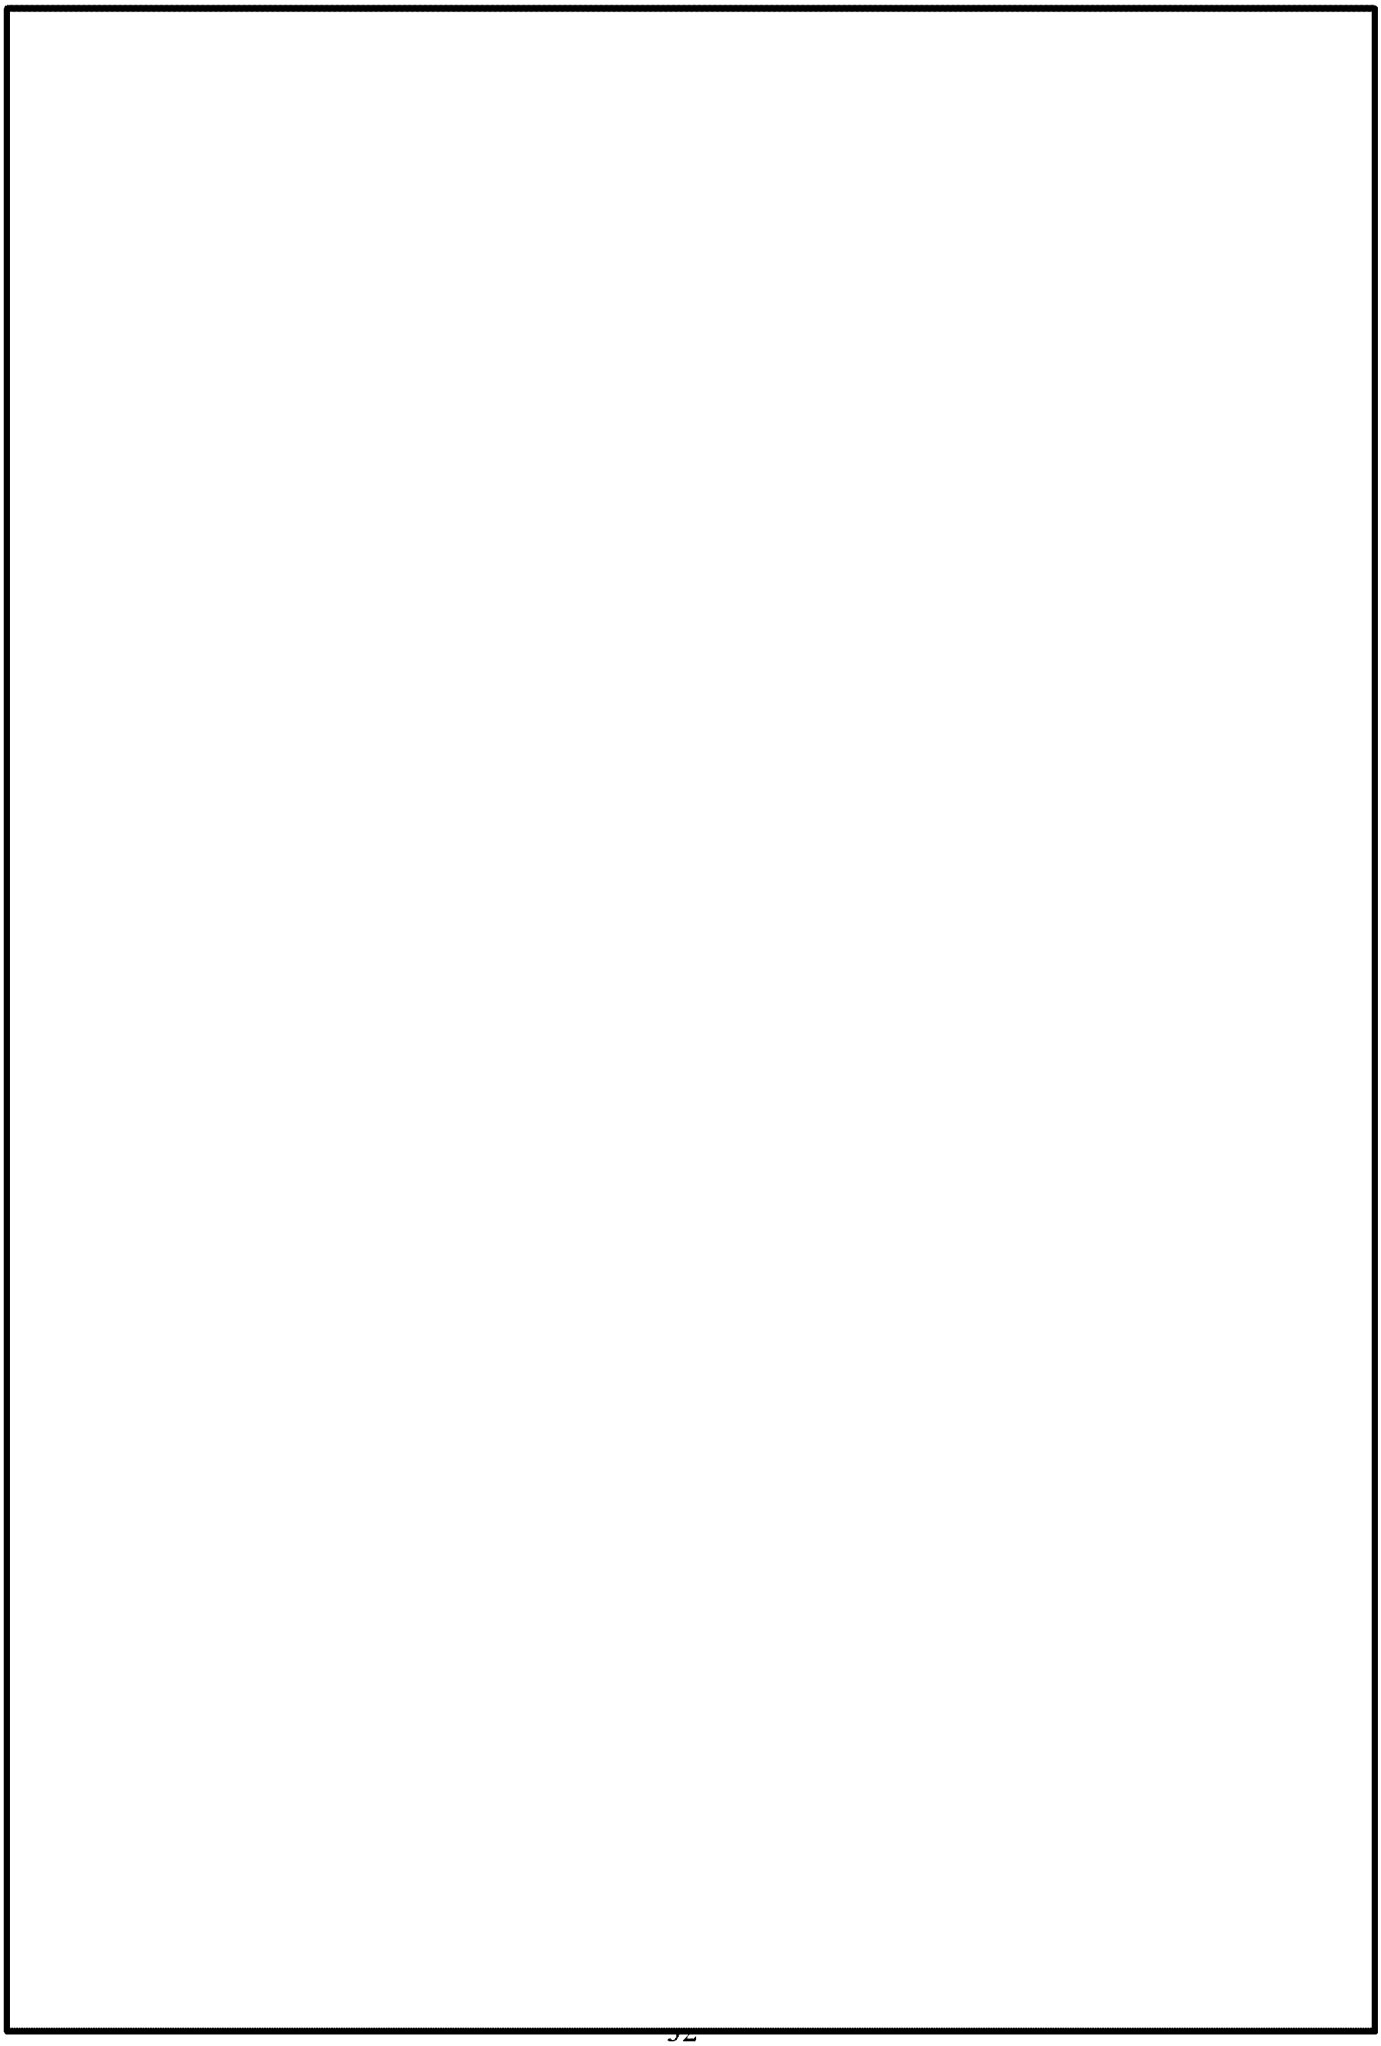
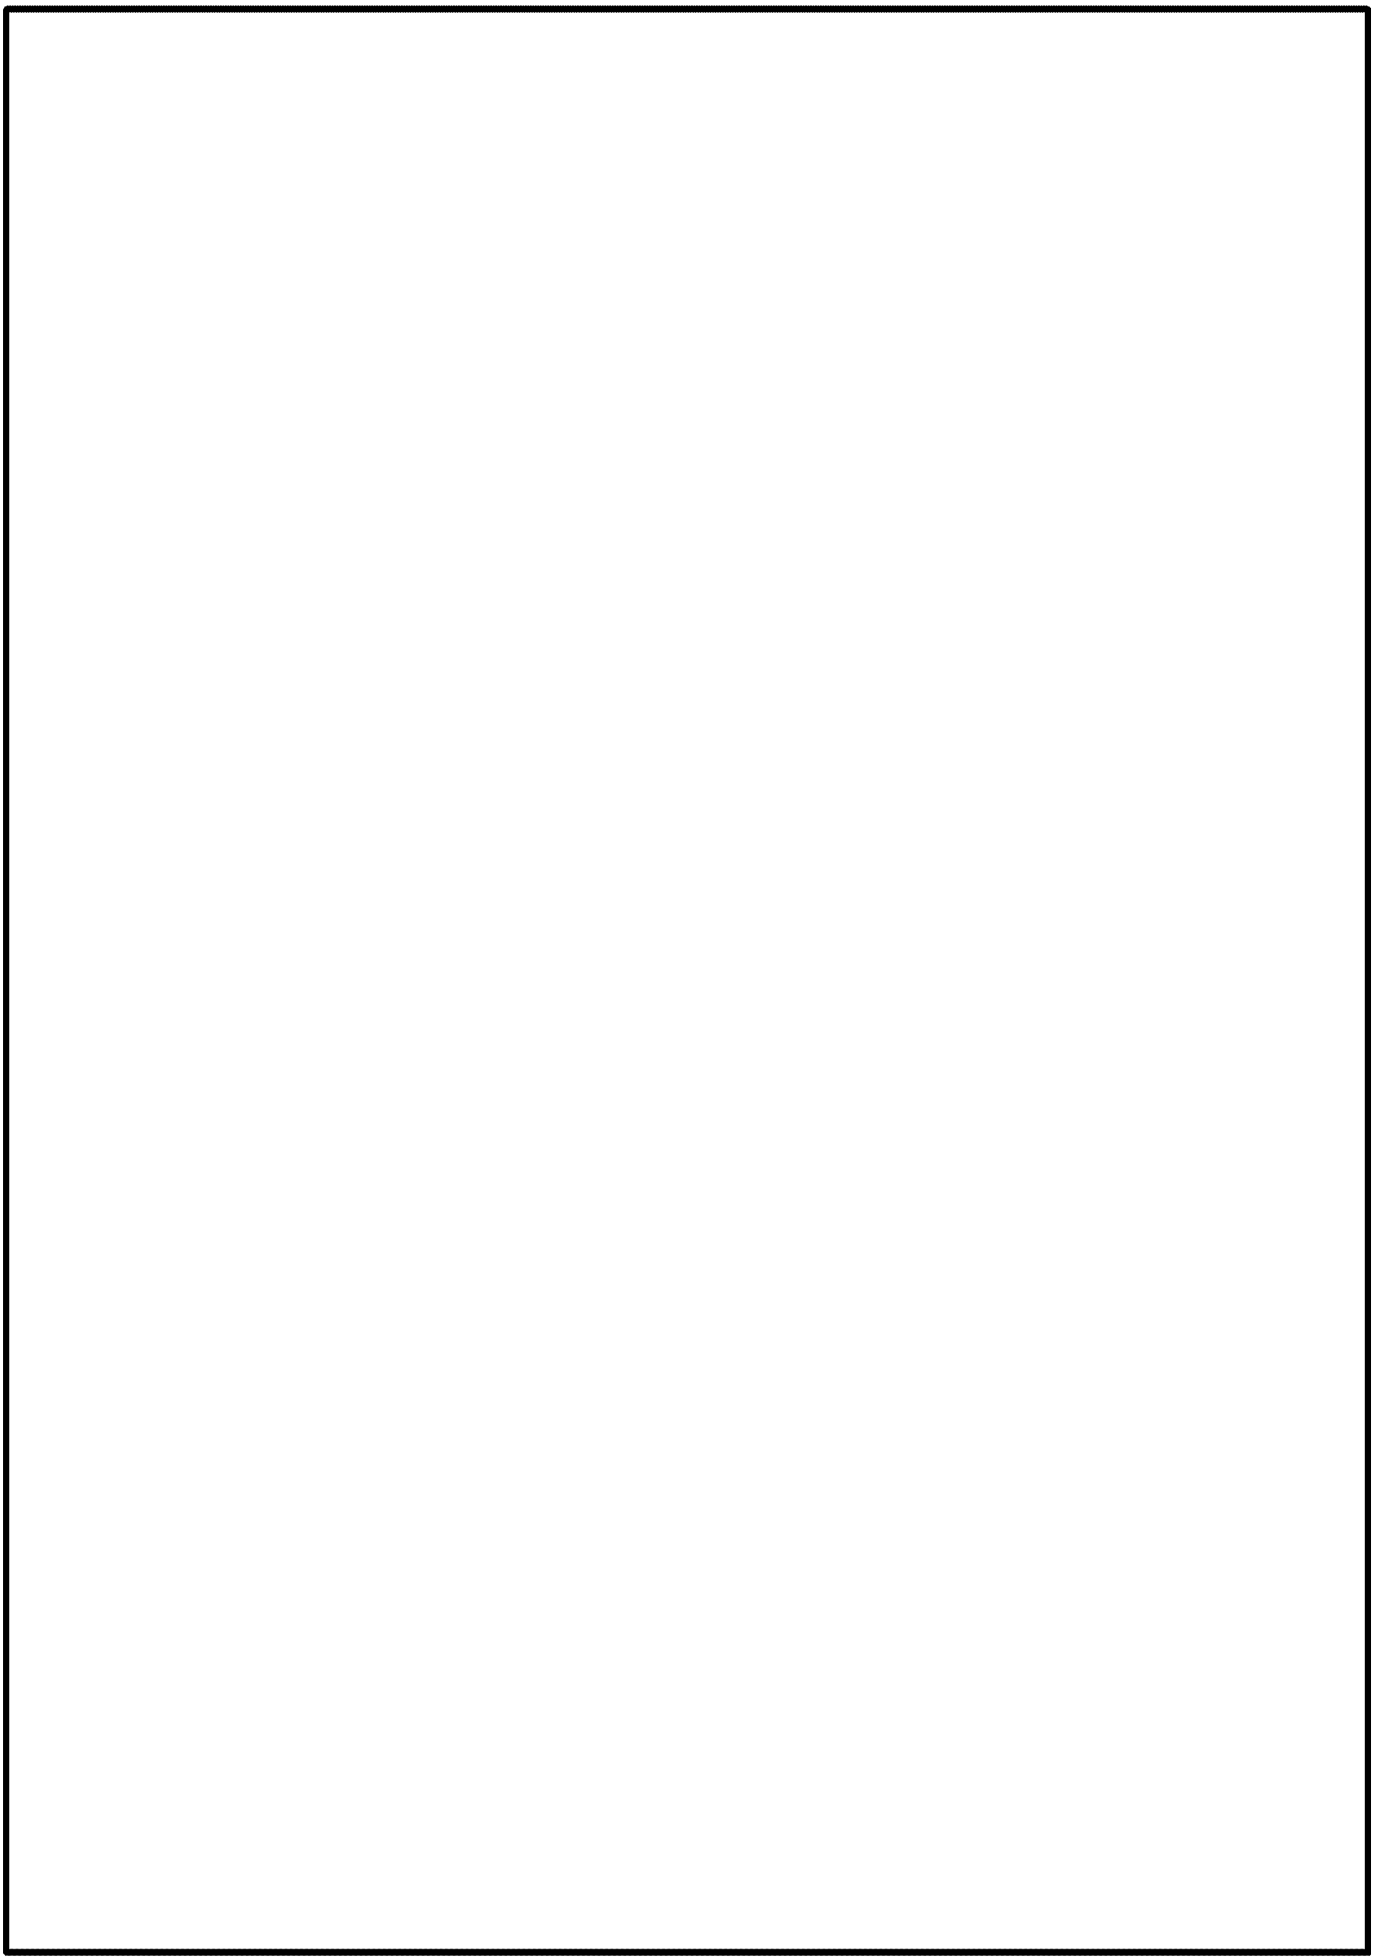
TAX CONSIDERATIONS

(b)(4)

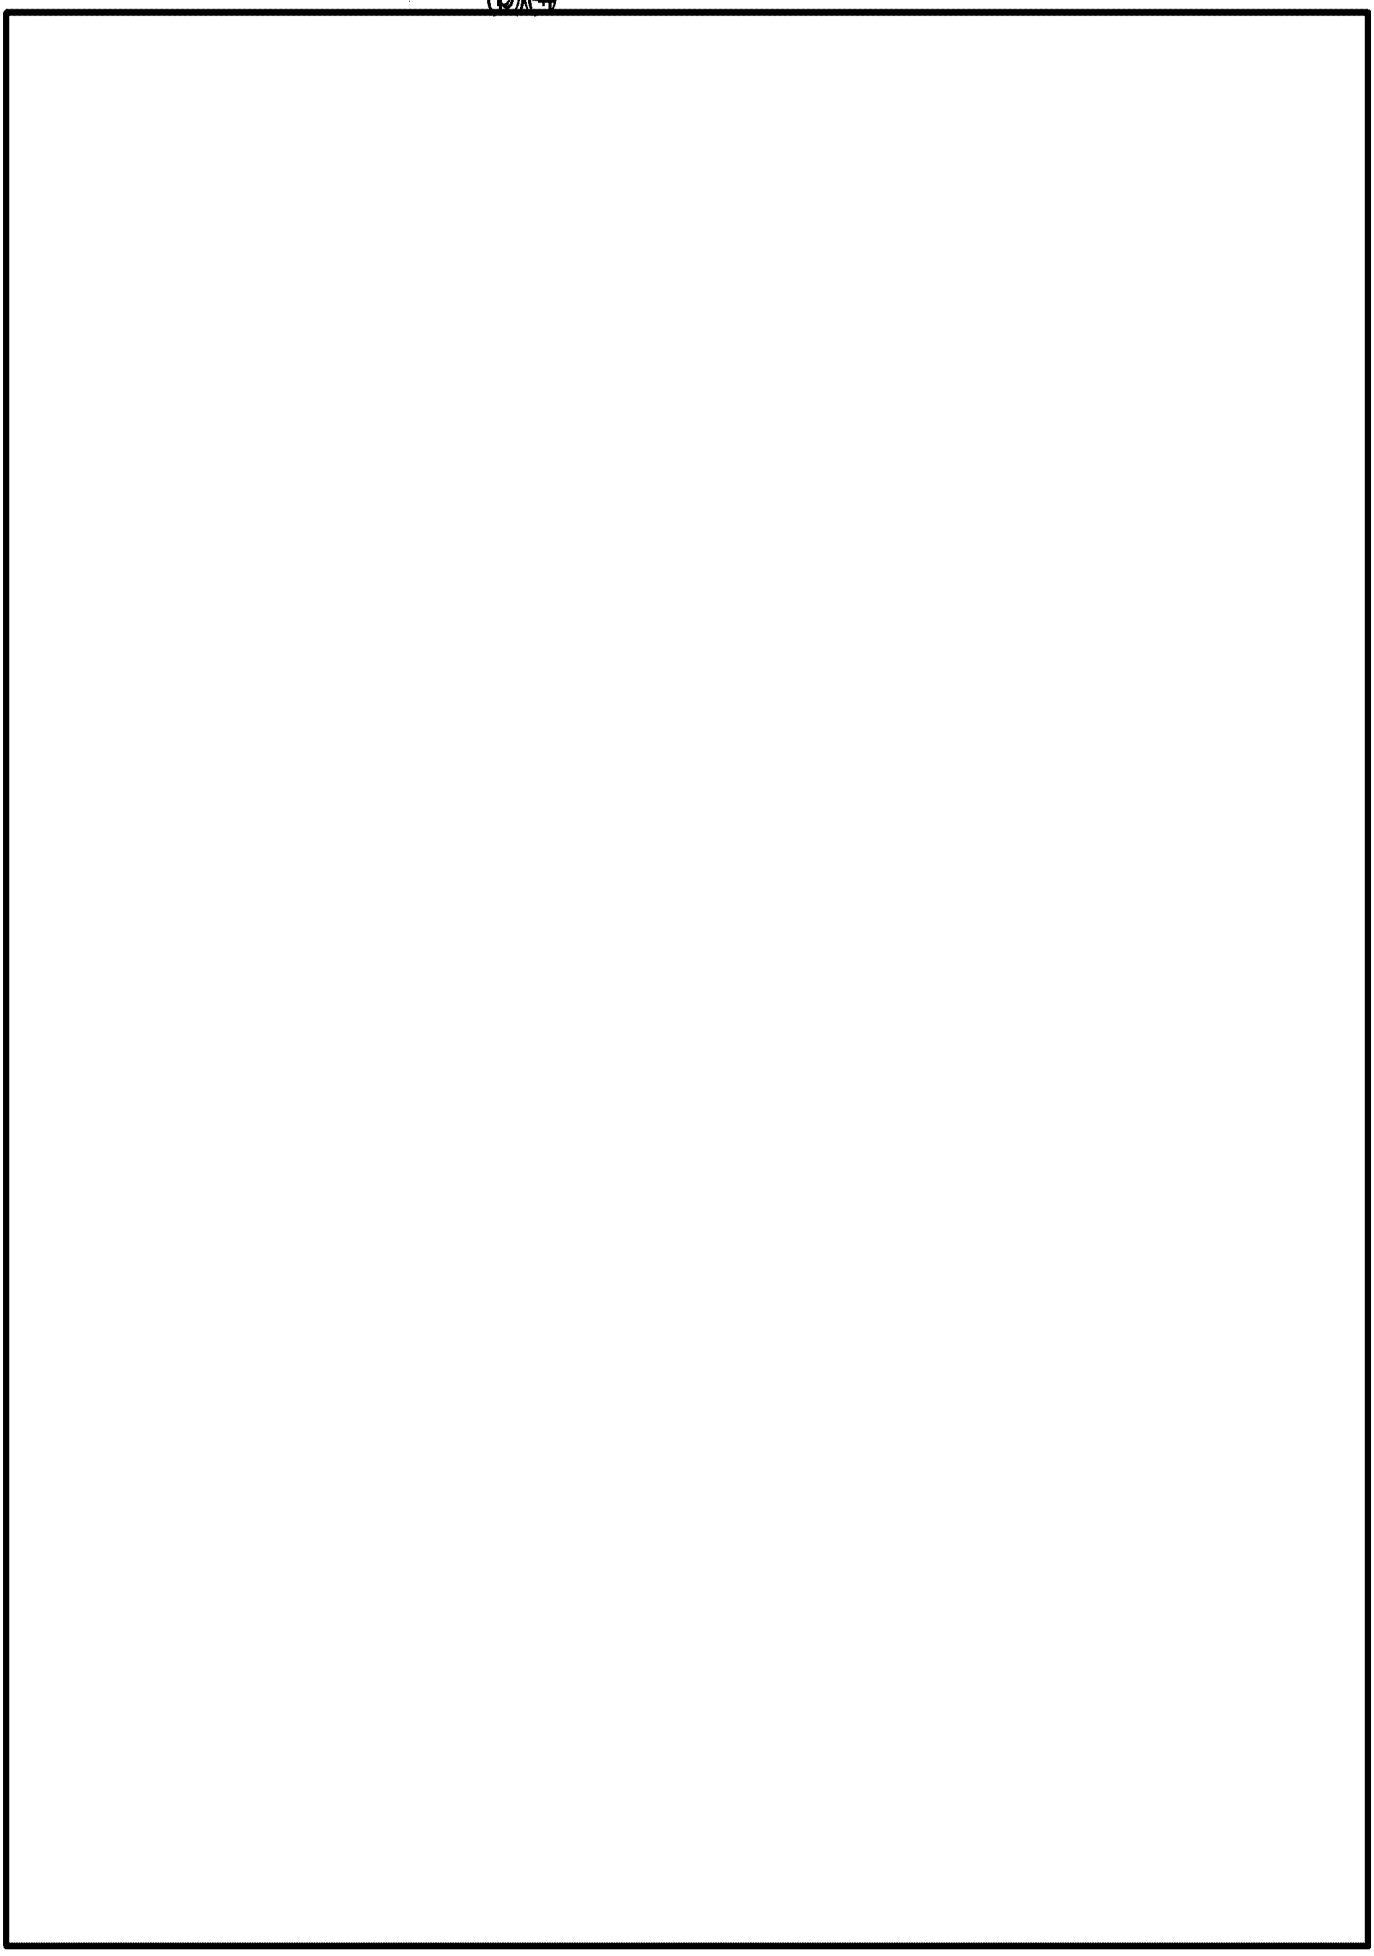


(b)(4)

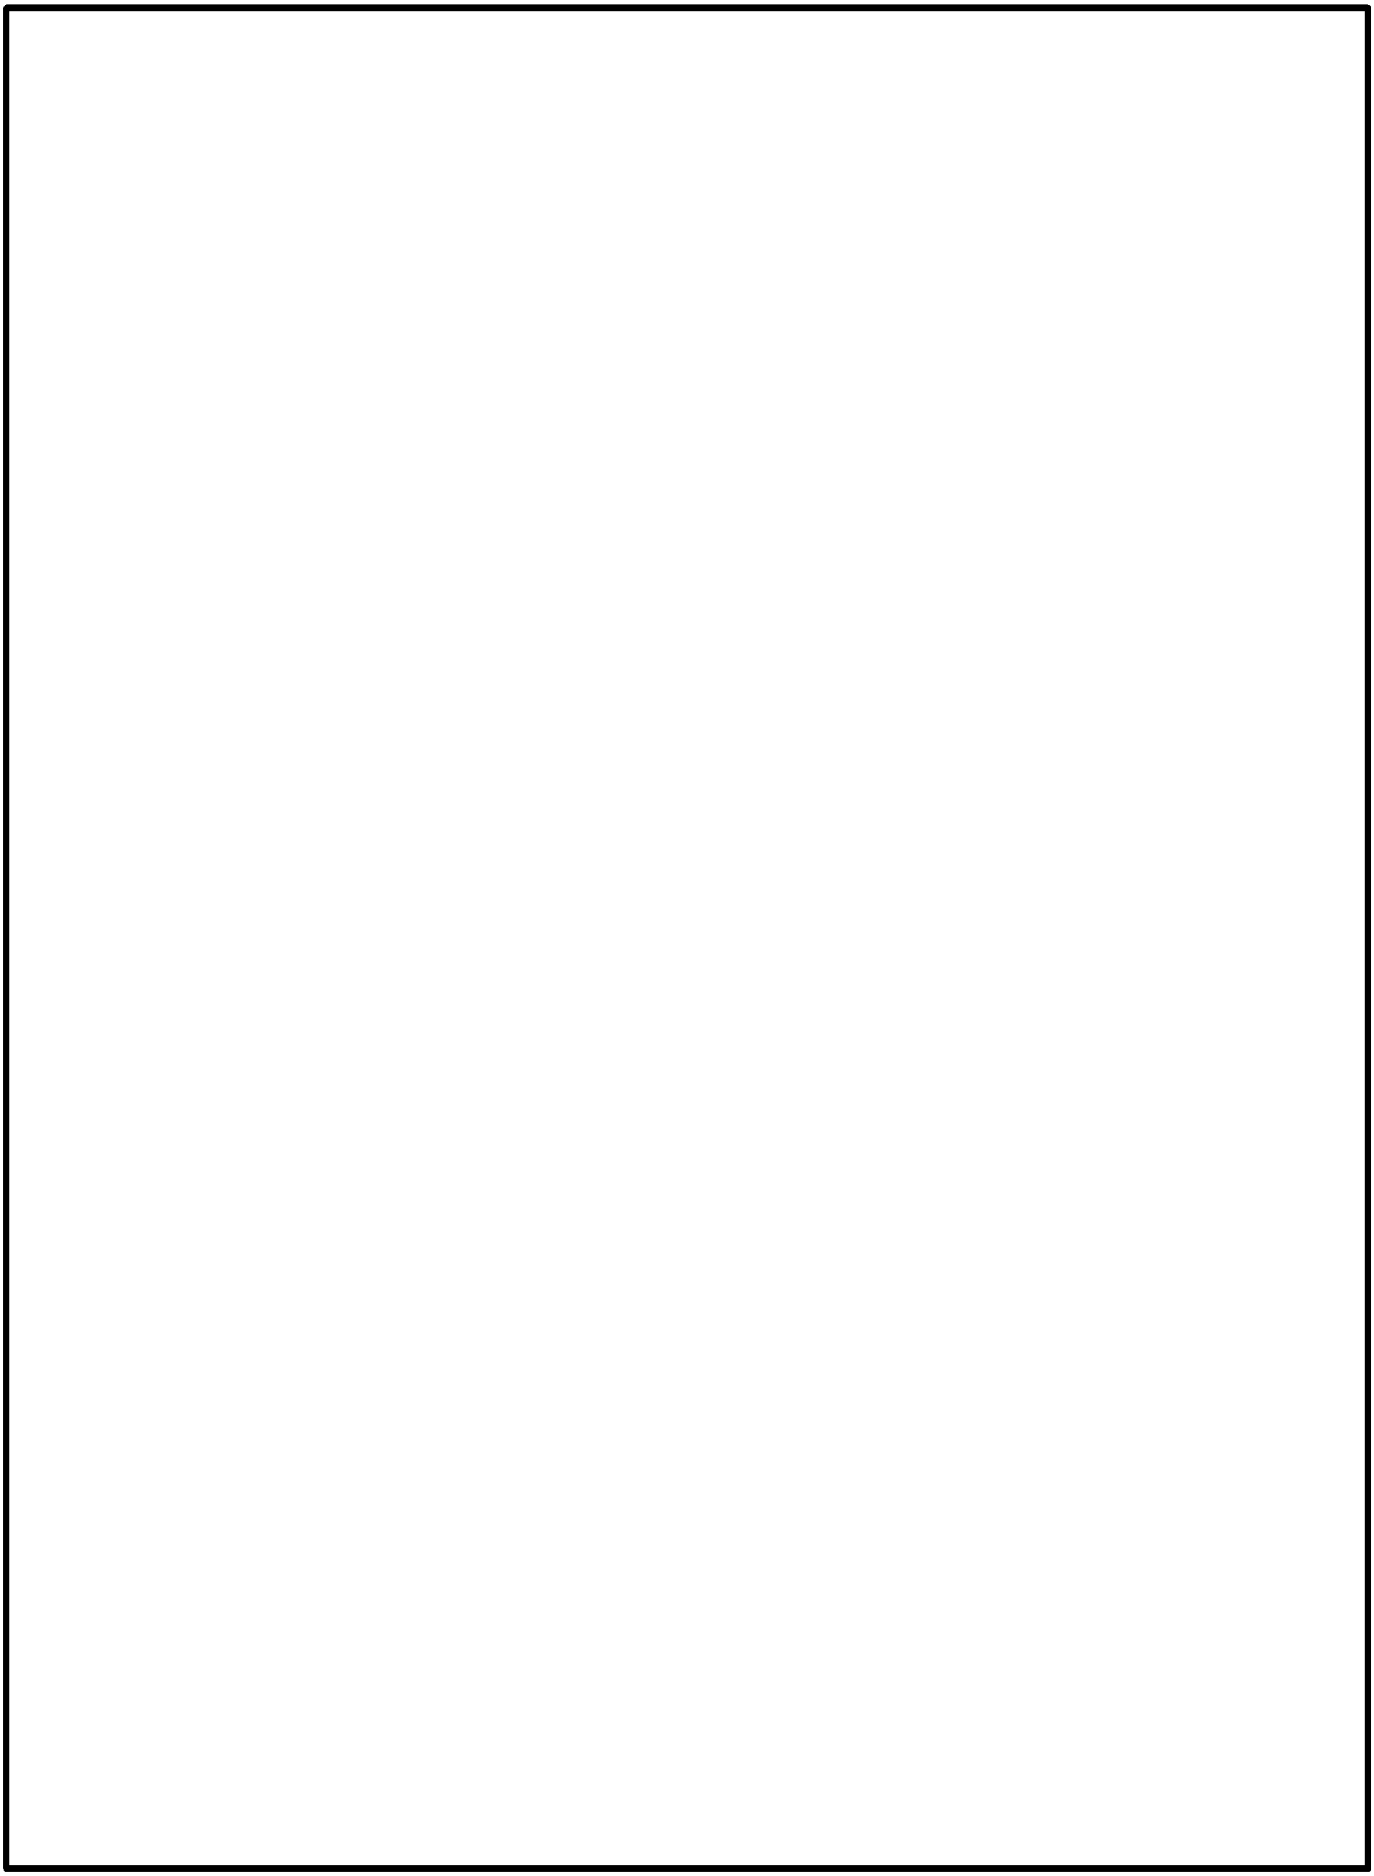




(b)(4)



(b)(4)



EB-5 IMMIGRATION DISCLOSURES AND RISK FACTORS

While the Company intends that this Offering and the provisions of the Company Agreement will enable the Members to satisfy the EB-5 requirements related to investment and job creation under USCIS law and regulations, there are no assurances that a Member's I-526 petition will be granted by USCIS or that a Member will be able to obtain an immigrant visa or unconditional lawful permanent resident status.

TEA Designation

USCIS regulations and interpretations hold that the targeted employment area (the "TEA") is not decided until the time that an investor's I-526 Petition is filed with USCIS. The unemployment statistics used to determine the TEA could change based on new data with respect to unemployment rates and, at the time of the investor's filing of his or her I-526 Petition, the area may no longer qualify as a TEA (*i.e.* an area that has experienced unemployment at a rate that is at least 150% of the national average). The New York State Department of Labor has designated the area where the Project is located as a TEA as of August 20, 2015. See TEA Designation Letter in Exhibit B.

TEA Deference

USCIS may not give deference in the future to state designation letters with respect to geographical areas or census tracts that were aggregated to form a TEA. As such, the Company cannot assure you that USCIS will continue to accept the designation of the area encompassing the Project as located as within a TEA.

Bridge Financing

The Project Company, may use some, if not all, of the Loan Amount to repay debt obtained from the Senior Lender and/or debt and equity obtained or contributed by the Sponsor to bridge construction and development expenses in anticipation of the proceeds of Loan, which is currently permitted by USCIS' May 30, 2013 Policy Memorandum. USCIS may change its position on the use of bridge financing and determine that the use of these proceeds to repay a portion of such bridge financing does not satisfy the job creation requirements of the EB-5 Program and/or USCIS may determine that there is no nexus between the proceeds and the creation of jobs, resulting in no credit given to investors for job creation necessary to support approval of the I-526 Petition(s) or the I-829 Petition(s) of all or a portion of the investors in the EB-5 Program.

Highly Regulated Program

The EB-5 Program was created in 1990 by the U.S. Congress, which has accorded broad regulatory powers to the Department of Homeland Security and, in particular, to USCIS in administering the EB-5 Program. While the Company will strive to coordinate with USCIS to achieve the investors' immigration goals, there can be no assurance that USCIS examiners will take a consistent position as to many of the issues arising under the EB-5 Program, and there can be no assurance that USCIS regulations, precedent case law and policies will remain the same in the future. Since the laws, regulations and USCIS interpretations of the EB-5 Program are subject to change at any time, there can be no assurance that the Loan to the Project will meet USCIS criteria.

Visa Unavailability; Retrogression.

The current law applies a country quota if the 10,000 visa cap is reached on an annual fiscal basis. The U.S. State Department's Visa Office in its July 2015 Visa Bulletin established a cut-off date for Chinese nationals of September 1, 2013. This means effective July 1, 2015, visa numbers will be unavailable for Chinese nationals having a priority date (I-526 Petition filing date) of September 1, 2013 or later. These investors will be required to wait until their priority date becomes "current" or is reached under the Visa Bulletin after I-526 petition approval to proceed to immigrant visa processing or adjustment of status. Members who are also Chinese nationals will be affected by visa unavailability as the July 2015 Visa Bulletin currently predicts that the EB-5 category will be subject to cut-off dates or visa unavailability "indefinitely." This may have a serious and adverse effect on EB-5 Program marketing in China, thereby potentially preventing the Company from raising the maximum amount of capital needed to complete the Project and from creating the necessary number of jobs estimated by the economic study. Visa unavailability could also result in Chinese nationals having to wait an extended period of time before they can complete the Visa Process and gain lawful permanent resident status. Visa unavailability may also limit the visa availability for the child of a Member if the child is under the age of 21 years at the time of the Member's filing of the I-526 Petition but over the age of 21 when a visa becomes available. Additionally, because a Member's investment in the Company must be "sustained" during the two years of their conditional residence, the time period before which a Member

can have his or her investment capital returned may be extended by the length of the visa unavailability subject to USCIS's adjudication standards to emerge during visa unavailability. This may require Member capital investment to be maintained in the Company or the Project for an extended period of time until the approval by USCIS to remove the Member's conditions on his or her permanent residence, thereby delaying the Member's "exit strategy". In addition, to the extent the repayment of the Loan predates the expiration of the conditional residence period, as extended by the length of the visa unavailability period, the Member may not be able to demonstrate that his or her investment in the Company was "sustained" during the entirety of the conditional residence period, subject to USCIS's adjudication standards to emerge during visa unavailability. USCIS has not issued any guidance regarding the impact of visa unavailability or retrogression on I-829 Petition adjudication. While legislation has previously been proposed to eliminate the per country quota to expand the number of visas available to Chinese nationals, there are no assurances that such legislation may ultimately become law.

Delay in Obtaining Conditional Lawful Permanent Resident Status

USCIS processing times are fluid; the processing times found on USCIS website are not always accurate. USCIS may issue a Request for Evidence ("RFE") or a Notice of Intent to Deny ("NOID") during the adjudication of the investor's I-526 Petition. The RFE or NOID can result in extensive delays in the adjudication of an individual's I-526 Petition. Likewise, USCIS may delay adjudications associated with a securities offering, such as this Offering, to consider policy issues related to the offering which may result in extensive delays in adjudication. USCIS delays could also result in long lapses of time between admitting investors into the Company as members which, in turn, could delay job creation, impacting an investor's ability to have his or her I-829 Petition approved.

USCIS Action to Terminate the Regional Center's Designation

USCIS may *sua sponte* terminate the Regional Center's designation as a regional center under the EB-5 Program at any time and for any reason, including concerns regarding job creating activities, economic development activities for which it was designated, or concerns over the immigration, securities or corporate formation documents submitted to USCIS at the time of the Regional Center's initial application to be designated as a regional center or at the time of any subsequent amendment filings.

General Immigration Risks

The process of obtaining conditional resident status and permanent resident status involves many factors and circumstances that are not within the Company's control. These include, among others, the investor's past history, history of alcohol and drug use, criminal history, past membership or association with certain political, social or religious groups, immigration visa backlogs, potential changes in immigration laws and regulations (including laws and regulations specific to the EB-5 Program), and quotas established by the U.S. government limiting the number of immigrant visas available to qualified individuals seeking permanent resident status under the EB-5 Program. Although the Company has been structured with the objective of providing the Members with eligibility for conditional and permanent resident status under the EB-5 Program, no assurance can be given that a Member will obtain approval of his or her particular immigrant application. Purchase of Interests does not guarantee temporary, conditional or permanent residence status in the U.S. Furthermore, no assurances or advice can be given that conditional resident status, if granted, will be converted to permanent resident status.

Job Creation and Retention Requirements

Under the EB-5 Program, the Company, by virtue of its Loan to the Borrower, must create 10 direct, indirect or induced full-time U.S. jobs per immigrant investor during a specified two year period in order for each such immigrant investor to have the conditions removed from that investor's conditional permanent resident status. For example, if the Company raises the anticipated offering amount of $8 million from 16 Investors seeking immigration benefits, the Company will be required to create at least 160 direct, indirect and/or induced jobs. The Company will rely on the Project, which may or may not hire or create the required number of jobs even if all of the Interests are sold. Additionally, job creation from the Project is estimated using the Regional Input/Output Model ("RIMS II"). Job creation based on RIMS II is evaluated based on economic activity of the Project such as construction expenditures and operating revenues. If the Project generates less initial economic activity than estimated for use in the RIMS II model, USCIS may conclude that the Project creates fewer jobs than initially anticipated. If an investor receives conditional lawful permanent resident status, but later does not receive lawful permanent resident status, the Company has no obligation to refund any of the investor's Capital Contribution to the Company or otherwise redeem the investor's Interests.

Allocation of Jobs

Jobs will be allocated to the Members for EB-5 purposes on a first-in, first-out basis tied to the date of the commencement of each Member's period of conditional residence in the U.S. (either the date of admission from outside the U.S. using the immigrant visa, or else the date of approval of adjustment of status for Member's located within the U.S.). This allocation process will continue until all jobs have been allocated to the Members and there is no guaranty that one or more Members will receive legal permanent residency in the United States as a result of his or her investment in the Company.

Background Check

According to USCIS policy, no application for lawful permanent residence will be approved until a definitive FBI fingerprint check and Interagency Border Inspection Services (IBIS) check are completed and resolved favorably. An EB-5 immigrant investor's background (or that of an immediate family member) may not meet USCIS or Department of State criteria for conditional or permanent residency in the U.S. For example, among other criteria, the following may be grounds for denial of immigration benefits for the immigrant, and/or other members of the immigrant's family: having a communicable disease or other dangerous contagious disease; having been at any time involved with, trafficking in, or taking, illegal drugs; having been convicted of certain crimes; having committed fraud or misrepresentation to a U.S. Government official; or having violated U.S. immigration laws in the past. If an investor receives I-526 Petition approval but later does not receive conditional or unconditional lawful permanent resident status, the Company has no obligation to refund any of the investor's Capital Contribution or Administrative Fee or otherwise redeem the investor's Interests. Other security checks could be required by USCIS, Department of State or other governmental agencies which could delay adjudication of the I-526 Petition or the subsequent application for conditional lawful permanent resident status.

Source of Funds

Immigrant investors must demonstrate to USCIS that the funds they intend to invest (or have invested) in the Company were obtained through lawful means. Further, each immigrant investor must document, to the satisfaction of USCIS, the source of these funds (e.g., whether the funds were income from a salary, sale of real estate, sale of stock, gifted, a loan, divorce settlement, etc.). The investor also must, to the best of his or her ability, trace the funds from the time they were obtained through the time they were invested in the Company. USCIS will retain ultimate authority in deciding whether the investor has met his or her burden of proof with respect to such tracing of funds and demonstrating the lawful source of such funds. Prior to subscribing for Interests, the investor must be prepared to present all documents relevant to lawful source of funds and tracing of these funds to the Manager. If the investor is unable or unwilling to provide timely to the Manager and/or USCIS evidence, satisfactory to the Manager, regarding the source and lawful nature of that Member's Capital Contribution, then, according to the terms of the Company Agreement, the Manager may expel the investor as a Member of the Company.

U.S. Immigration Residency Requirements

Immigrant investors who obtain conditional or lawful permanent resident status under the EB-5 Program must intend to make the U.S. their primary residence. Lawful permanent residents who maintain their primary residence outside the U.S. risk revocation of their U.S. residence status. Each prospective immigrant investor should consult a competent immigration attorney to review the likelihood that the investor's immigration objectives will be achieved. The Company must satisfy the job creation and retention requirements of the EB-5 Program at the time when the investors file for the removal of the condition of their permanent residency. If an investor fails to obtain or later loses his or her lawful permanent resident status because of a failure to comply with the residency requirements of the EB-5 Program, the Company has no obligation to refund any portion of that investor's investment in the Interests or otherwise redeem the investor's Interests regardless of whether the investor requests a refund of his or her investment.

Material Change in Business Plan

The Company's or the Project Company's business operations may not proceed according to the business plan submitted with the investor's original I-526 Petition because of economic conditions, weather conditions, labor conditions, competitive conditions or other factors. A material change from the Project Company's original business plan after I-526 submission and prior to obtaining conditional permanent residence could result in denial or even revocation of the initial I-526 petition and the need to file a new I-526 Petition, resulting in a delay in the immigration process as well as the possibility of qualifying children reaching the age of 21 to become disqualified from obtaining immigration benefits along with the principal petitioner. A material change from the Project Company's original business plan between the time of I-526 Petition approval and I-829 Petition approval may lead to the denial of an investor's I-829 Petition. USCIS' May 30, 2013 Policy Memorandum states that USCIS will review I-829 Petitions for compliance with the regulations even if there is a material change in the business plan. However, it is not known whether USCIS will follow this new policy or how it will apply this policy, and USCIS has

not defined a "material change." If the I-829 Petition is denied on this basis, USCIS can place the investor into removal proceedings where the investor's conditional lawful permanent resident status may be terminated, making the investor deportable.

Incorrect Job Creation Analysis

The estimated number of jobs to be created by the Project is based on the findings of an economic impact analysis (the "Analysis") prepared by Evans, Carroll & Associates, Inc. The estimates are based on assumptions and projections that may be rejected by USCIS as incorrect or insufficient. If the projected number of jobs to be created is incorrect, the fulfillment of the conditions of the EB-5 Program could be placed in jeopardy. Further, this could result in the denial of the removal of conditions on your residency in the U.S. (*i.e.*, I-829 petition denial). The Company will provide a copy of the Analysis to all investors on request, and in connection with the filing of their I-526 petitions with USCIS.

Visa Eligibility

Even after approval of the I-526 Petition, there is no guarantee that the Member, his or her spouse or any of their minor, unmarried children will be granted lawful permanent residence. The grant of such immigration status is dependent, among other things, upon the personal and financial history of each applicant. Any one of several government agencies may determine in its discretion, sometimes without the possibility of appeal, that an applicant for lawful permanent residence is excludable from the United States. In limited instances, a waiver of a ground of exclusion may be available under the law, but adjudications of waiver applications are themselves made in the unreviewable discretion of the United States.

Statutory Presumption of Inadmissibility

Persons applying for lawful permanent residence must overcome the statutory presumption of inadmissibility. Applicants must demonstrate, affirmatively, that they are admissible to the United States. There are many grounds of inadmissibility that the government may cite as a basis to deny admission for lawful permanent residence. Various statutes, including for example Sections 212, 237 & 241 of the Immigration Act, the Antiterrorism & Effective Death Penalty Act of 1996 and the Illegal Immigration Reform & Immigrant Responsibility Act of 1996 set forth grounds of inadmissibility, which may prevent an otherwise eligible applicant from receiving an immigrant visa, entering the United States or adjusting to lawful permanent residence.

Examples of aliens precluded from entering the United States include:

(a) persons who are determined to have a communicable disease of public health significance;

(b) persons who are found to have, or have had, a physical or mental disorder and behavior associated with the disorder which poses or may pose, a threat to the property, safety, or welfare of the alien or of others, or have had a physical or mental disorder and a history of behavior associated with the disorder, which behavior has posed a threat to the property, safety, or welfare of the immigrant alien or others, and which behavior is likely to recur or to lead to other harmful behavior;

(c) persons who have been convicted of a crime involving moral turpitude (other than a purely political offense), or persons who admit having committed the essential elements of such a crime;

(d) persons who have been convicted of any law or regulation relating to a controlled substance, admitted to having committed or admits committing acts which constitute the essential elements of same;

(e) persons who are convicted of multiple crimes (other than purely political offenses) regardless of whether the conviction was in a single trial or whether the offenses arose from a single scheme of misconduct and regardless of whether such offenses involved moral turpitude;

(f) persons who are known, or for whom there is reason to believe, are, or have been, traffickers in controlled substances;

(g) persons engaged in prostitution or commercialized vice;

(h) persons who have committed in the United States certain serious criminal offenses, regardless of whether such offense was not prosecuted as a result of diplomatic immunity;

(i) persons excludable on grounds related to national security, related grounds, or terrorist activities;

(j) persons determined to be excludable by the secretary of state of the United States on grounds related to foreign policy;

(k) persons who are or have been a member of a totalitarian party, or persons who have participated in Nazi persecutions or genocide;

(l) persons who are likely to become a public charge at any time after entry;

(m) persons who were previously deported or excluded and deported from the United States;

(n) persons who by fraud or willfully misrepresenting a material fact, seek to procure (or have procured) a visa, other documentation or entry into the United States or other benefit under the Act;

(o) persons who have at any time assisted or aided any other alien to enter or try to enter the United States in violation of law;

(p) certain aliens who have departed the United States to avoid or evade U.S. Military service or training;

(q) persons who are practicing polygamists; and

(r) persons who were unlawfully present in the United States for continuous or cumulative periods in excess of 180 days.

Conditional Residency

Lawful permanent residence status granted initially to the Member, his or her spouse and their qualifying children is "conditional." The Member, his or her spouse and their qualifying children must seek removal of conditions before the second anniversary of lawful permanent admission to the United States. There is no assurance that USCIS will grant the removal of conditions as to the Member, his or her spouse and their qualifying children. If the Member fails to have conditions removed, the Member, his or her spouse and their qualifying children will be required to leave the United States and may be placed in removal proceedings. Even if the Member succeeds in having conditions removed, the Member, his or her spouse and each of their qualifying children, separately, must have conditions removed. Failure to have conditions removed as to any of these members of the Member's family may require some members to depart from the United States and such family members may be placed in removal proceedings. Examples of possible reasons for denial of the Member's petition to remove conditions from permanent residence include:

- failure to sustain the investment for the required two years, such as through return of the Member's capital before the time for removal of conditions on the Member's residence, even if 10 jobs were created;
- failure to maintain investment according to USCIS due to a repayment of the Loan to the Company even though such a repayment may not result in any return of the Member's capital;
- failure of the Project to use all of the Member's Capital Contribution in job creating activity, according to technical requirements of USCIS (some of which are not clearly articulated and which could change over time), even if 10 jobs were created;
- failure to show that the Member's investment has created 10 new jobs for U.S. workers that can be allocated to such Member (which may result from failure to meet the Project's economic milestones that were used as assumptions in projection of the direct, indirect and induced jobs that would be created by the Member's investment); and
- even if the required 10 jobs were created, the Project's material departure from the business plan presented to USCIS in obtaining approval of the Member's I-526 Petition.

Removal of Conditions

USCIS regulations governing lawful permanent residence for foreign investors do not state specifically the criteria which USCIS must apply to determine eligibility for the removal of conditions to lawful permanent resident status. U.S. courts have determined some standards to be followed by USCIS in some, but not all, circumstances. The Company may make certain management decisions in the absence of these specific eligibility criteria. The Company will seek as much information as possible from USCIS in an effort to assist Members in their attempts to qualify for the removal of conditions, where good business practices permit. Notwithstanding the foregoing, Members should become educated about the standards that will determine eligibility to achieve unconditional lawful permanent residence in the United States pursuant to this program which currently is in a state of evolution.

EB-5 Regional Center Pilot Program

In 1992, the U.S. Congress enacted the EB-5 Regional Center Program to stimulate interest in the EB-5 program. As a "pilot," the Regional Center Pilot Program is not yet permanent, and consequently requires periodic renewal by Congress. The Regional Center Pilot Program has been renewed several times by Congress and is currently due to expire or "sunset" on September 30, 2015. Congress is expected to renew this program prior to its expiration, or make the program permanent by removing its "pilot" designation. However, there is a risk that Congress may not renew, or not renew before the current expiration date. If the Regional Center Pilot Program is not renewed before expiration, the effect of the gap on pending immigration petitions is unknown. In the past, USCIS indicated that it would hold pending I-526 Petitions "in abeyance" for an indeterminate period of time until USCIS renewed the Regional Center Pilot Program. USCIS may or may not follow the same procedure. With respect to Immigrant Visa issuance, in the past the U.S. State Department announced that it would issue regional center-based EB-5 immigrant visas until close of business on the sunset date. The U.S. State Department may or may not follow the same procedure. Finally, with respect to admission to the U.S., in the past U.S Customs and Border Protection announced that it would admit EB-5 immigrant visa holders after the sunset date during the full validity period of the immigrant visa. U.S. Customs and Border Protection may or may not follow the same procedure.

It connection with any renewal of the Regional Center Pilot Program, Congress may impose new requirements or modify existing requirements. For example, Congress may change the TEA definition or raise the minimum capital investment amount. It is uncertain at this time whether Congress will impose any of these or any other new or changed requirement and when such new or changed requirement will be made effective. Any such requirement imposed in connection with the renewal of the Regional Center Pilot Program could adversely affect a Member's immigration process or benefit.

Change in Legislation or Policy

There may be change in U.S. laws or policy after the date of this Memorandum. The immigration laws and the corresponding rules, regulations and USCIS interpretations related to the EB-5 Program and the corresponding applications are in a constant state of flux, and there are no assurances that new laws and/or interpretations will result that will otherwise modify the disclosures and information set forth in this Memorandum.

Admissible to the U.S.: Foreign persons applying for a U.S. Green Card must demonstrate that they are admissible to the U.S. Section 212 of the Immigration and Nationality Act sets forth various grounds of inadmissibility, which may prevent an otherwise eligible applicant from receiving a green card or entering the U.S. Foreign individuals who are ineligible to receive a Green Card or to be admitted to the U.S. include, but are not limited to, an individual who (1) is determined to have a communicable disease of public health significance, which shall include infection with the etiologic agent for acquired immune deficiency syndrome; (2) is determined to have a physical or mental disorder and behavior associated with the disorder that may pose, or has posed, a threat to the property, safety, or welfare of the individual or others; (3) is determined to have had a physical or mental disorder and a history of behavior associated with the disorder, which behavior has posed a threat to the property, safety, or welfare of the individual or others, and which behavior is likely to recur or to lead to other harmful behavior; (4) is determined to be a drug abuser or addict; (5) has been convicted of committing, or who admits having committed, acts which constitute the essential elements of a crime involving moral turpitude (other than a purely political offense), or a violation of (or a conspiracy or attempt to violate) any law or regulation of a State, the United States, or a foreign country relating to a controlled substance; (6) has been convicted of 2 or more offenses (other than purely political offenses), regardless of whether the conviction was in a single trial or whether the offenses arose from a single scheme of misconduct and regardless of whether the offenses involved moral turpitude, for which the aggregate sentences to confinement were 5 years or more; (7) is or has been an illicit trafficker in any controlled substance or in any listed chemical (as defined in section 102 of the Controlled Substances Act (21 U.S.C. § 802), or is or has been a knowing aider, abettor, assister, conspirator, or colluder with others in the illicit trafficking in any such controlled or listed substance or chemical, or endeavored to do so; (8) is the spouse, son, or daughter of an alien inadmissible under clause (7) and has, within the previous 5 years, obtained any financial or other benefit from the illicit activity of that alien, and knew or reasonably should have known that the financial or other benefit was the product of such illicit activity; (9) is coming to the U.S. solely, principally, or incidentally to engage in prostitution, or has engaged in prostitution within 10 years of the date of application for a visa, admission, or adjustment of status; (10) directly or indirectly procures or attempts to procure, or (within 10 years of the date of application for a visa, admission, or adjustment of status) procured or attempted to procure or to import, prostitutes or persons for the purpose of prostitution, or receives or (within such 10 year period) received, in whole or in part, the proceeds of prostitution; (11) is coming to the United States to engage in any other unlawful commercialized vice, whether or not related to prostitution; (12) has committed in the U.S. a serious criminal offense, regardless of whether such offense was prosecuted as a result of diplomatic immunity; (13) is excludable from the U.S. on grounds relating to national security, related grounds, or terrorist activities; (14) is excludable from the U.S. on grounds relating to foreign policy; (15) is or has been a member of or affiliated with the Communist or any other totalitarian party or who has participated in Nazi prosecutions or genocide; (16) is likely to become a public charge at any time after entry; (17) by fraud or willfully misrepresenting a material fact, seeks to procure (or has sought to procure or has procured) a visa, other documentation, or admission into the U.S.; (18) illegally entered into the U.S.; or (19) has at any time knowingly encouraged, induced, assisted, abetted, or aided any other alien to enter or to try to enter the U.S. in violation of law.

8. Economic Impact of Construction Activity 72

9. Economic Impact of Hotel Operations 83

10. Summary Tables for the Entire Project 90

Appendix: Resume of Dr. Michael K. Evans 92

1. Executive Summary

• Mona Shah and Associates plans to raise EB-5 funds for the development and operation of a Holiday Inn Express, to be located at 64-06 Queens Blvd, Woodside, NY. The hotel will have 135 rooms and suites. This report contains the economic impact analysis for the hard and soft costs of construction, purchases of FF&E, and hotel operations. The developer will maintain an ownership interest in the hotel, so direct jobs can be counted for that activity.

• The calculations are based on the RIMS II input/output model for 23 of the 30 counties in the New York Combined Statistical Area (CSA). This area has already been approved by USCIS for a regional center. These counties are as follows:

1. NYC—New York, Bronx, Richmond, Kings, Queens, Westchester, Rockland
2. Upstate New York Suburbs —Putnam, Dutchess, Orange, Ulster
3. Long Island—Nassau, Suffolk
4. Connecticut—Litchfield, New Haven, Fairfield
5. New Jersey —Bergen, Essex, Hudson, Morris, Passaic, Sussex, Union

(b)(4)

• For EB-5 purposes, some hard and soft costs listed by the developer are not eligible for job creation. The EB-5 eligible figures are [redacted] for hard costs, [redacted] for architectural and engineering fees, and [redacted] for purchases of FF&E. Further details are found in Section (8).

• All these figures are given in 2015 dollars, and should be deflated to 2010 dollars, since the input/output data are in 2010 dollars. Using the appropriate PPI indexes, the estimated cost of nonresidential construction would be expected to rise 13.3% over the five-year period, the cost of architectural and engineering fees would rise 7.7%, and the cost of FF&E would rise 4.0%; further details are discussed in Section (8). Thus in 2010 dollars, the EB-5 eligible figures would be [redacted] for hard costs, [redacted] for EB-5 eligible soft costs, and [redacted] for purchases of FF&E.

• Since the project will take 27 months to construct, direct as well as indirect and induced jobs may be included in the EB-5 job count for hard and soft construction costs. The final demand multipliers are 13.2149 and 11.9014 respectively. For the purchases of FF&E, direct jobs are excluded, so that multiplier would be 5.6974. Hence 184 new jobs would be created from hard construction costs, [redacted] new jobs from soft costs, and [redacted] new jobs from the purchases of FF&E, for a total of [redacted] new jobs from all facets of construction expenditures.

• The pro forma income statement provided by the developer indicates an ADR of [redacted] in 2018 and an occupancy rate of 75%. Since there are 135 rooms, that would be [redacted] in hotel room revenues. When ancillary revenues are added, the figure rises to [redacted] Assuming a 3% annual inflation rate for hotel room prices, that would be deflated to [redacted] in 2010 dollars. The final demand multiplier is 15.0799, so that would create another [redacted] new jobs, of which [redacted] are direct jobs. That

(b)(4)

would be about [redacted] direct employees per room, which is consistent with industry standards for a limited-service hotel.

- **Summing these three components, there would be a total of [redacted] permanent new jobs created for the hotel at 64-06 Queens Blvd, Woodside, NY, which is located in census tract (CT) 245 in Queens County. When combined with contiguous CTs, an area can be formed with an unemployment rate exceeding 9.3% in 2014, which qualifies as a TEA. Hence up to [redacted] EB-5 investors can each raise $500,000, for a total of up to [redacted] in EB-5 funds for this project.**

2. Tabulation of Principal Results

Table A shows the annual expenditures and revenue, the final demand multiplier, and the total number of jobs created by the construction, hotel operation, and rental income of the building. All figures are permanent jobs. Direct jobs are calculated as total jobs divided by the employment multipliers given in Column (6) of Table B-2.

Table A. Summary of Employment and Revenue Estimates

Activity	Exp/Rev mil cur $	Exp/Rev mil 2010 $	RIMS II Mult	Total Jobs	Direct Jobs
Hard construction costs	[redacted]		13.2149	[redacted]	
Architect & Engineering Svcs			11.9014		
Purchase of FF&E *			5.6974		
Hotel Operations			15.0799		
Total					

All figures based on unrounded numbers

* Indirect and induced jobs only

Table B1 shows the NAICS codes for each type of economic activity. The descriptions are taken from: (b)(4) http://www.census.gov/cgi-bin/sssd/naics/naicsrch?chart=2012. Table B-2 shows the print screen of all the RIMS II multipliers used in this study, based on the 23-county area listed below

Table B-1. NAICS Codes for Each Type of Activity

2361	Residential Building Construction
2362	Nonresidential Building Construction
5413	Architectural, Engineering, and Related Services
4232	Furniture and Home Furnishing Merchant Wholesalers
4234	Professional and Commercial Equipment and Supplies Merchant Wholesalers
4236	Household Appliances and Electrical and Electronic Goods Merchant Wholesalers
5311	Lessors of Real Estate
7211	Traveler Accommodation

Table B2. Print Screen of Multipliers

	(1)	(2)	(3)	(4)	(5)	(6)
230000 Construction	1.9404	0.6293	13.2149	1.0609	1.7263	1.8832
541300 Architectural, engineering, and related services	2.0077	0.6555	11.9014	1.2448	1.8409	2.5144

*Includes Government enterprises.

1. Each entry in column 1 represents the total dollar change in output that occurs in all industries for each additional dollar of output delivered to final demand by the industry corresponding to the entry.
2. Each entry in column 2 represents the total dollar change in earnings of households employed by all industries for each additional dollar of output delivered to final demand by the industry corresponding to the entry.
3. Each entry in column 3 represents the total change in number of jobs that occurs in all industries for each additional 1 million dollars of output delivered to final demand by the industry corresponding to the entry. Because the employment multipliers are based on 2010 data, the output delivered to final demand should be in 2010 dollars.
4. Each entry in column 4 represents the total dollar change in value added that occurs in all industries for each additional dollar of output delivered to final demand by the industry corresponding to the entry.
5. Each entry in column 5 represents the total dollar change in earnings of households employed by all industries for each additional dollar of earnings paid directly to households employed by the industry corresponding to the entry.
6. Each entry in column 6 represents the total change in number of jobs in all industries for each additional job in the industry corresponding to the entry.

NOTE.--Multipliers are based on the 2002 Benchmark Input-Output Table for the Nation and 2010 regional data. Industry List A identifies the industries corresponding to the entries.

SOURCE.--Regional Input-Output Modeling System (RIMS II), Regional Product Division, Bureau of Economic Analysis.

Table C shows the annual level of household income, and the output for utilities, maintenance and repair construction, manufacturing output, and professional and business support services for the construction of the building and hotel operations.

Table C. Summary Measures of Economic Impact for Construction and Hotel Operations

All figures in thousands of dollars

Household Income from	
Hard construction costs	
Architect & Engineering Svcs	
Purchases of FF&E	(b)(4)
Hotel operations	
Total these 4 categories	
Demand (output) for:	
Utilities	
Maintenance and repair construction	
Supplier/vendor links with manufacturers	
Professional and business support services	
Total these 4 categories	

Household Earnings (Labor Income) (b)(4)

The jobs created by the project subsequently create new sources of household income. The household income created within the regional center by the construction of the building and hotel operations is about [redacted]

The details used to calculate these figures are given throughout the report. Separate tables are provided for the total number of jobs created, the average earnings per new worker, and the total increase in earnings for construction and hotel operations. In each case, the RIMS II input/output model has been used to calculate the number of jobs in each major industrial classification, the average earnings per employee, and hence total earnings. The number of jobs by industrial classification is based on calculations imbedded in the RIMS II model for each of the activities as summarized in Table A and documented in detail throughout this report.

Demand for Business Services, Utilities, Maintenance and Construction, and New Supplier/Vendor Relationships Created with Manufacturers

The total economic impact of the regional center from the supplier purchases and business relationships for the construction and hotel operations would create approximately [redacted] in additional economic activity across the region for the project. These supplier purchases are calculated from the indirect increase in output generated by the RIMS II model. It should be noted that some of these supplier industries might potentially locate within the regional center, and their economic output is included in this total.

The estimate of supplier purchases is based on the commodity data in the RIMS II input-output model. This data specifies the amount and type of commodity input needed to maintain specific types of business operations. The model estimates the supplier purchases based on the types of jobs and number of jobs that will be created within the regional center. In addition, the model allocates the supplier purchases to businesses within the region, based on trade flow data from the U.S. Bureau of Economic Analysis.

Utilities include services such as electricity, natural gas, and water and sewer facilities. The economic impact on utility services totals about [redacted]

Maintenance and repair services include some building and construction activity on existing buildings. The regional center would create an economic impact of about [redacted] These expenditures represent permanent, ongoing maintenance on the building after it is completed; they do not reflect the initial construction costs.

New supplier/vendor relationships with manufacturers would create an economic impact of about [redacted] This output primarily represents purchases of locally produced materials and parts for the construction of the building, although it also includes locally produced goods used in the hotel operations.

(b)(4)

The regional center will also create demand for various types of business services, including professional and scientific services, management of companies, administrative services, and building support and waste management services. The impact of this activity totals about [redacted] (b)(4) This primarily represents payments to architects and engineers for the construction activities, and also includes outsourcing of professional services, such as legal and accounting, by the hotel and rental income management.

The figures given in Table C represent only a brief summary of the detailed calculations that have been undertaken and are reported in tabular format throughout the report. The figure for utility output, for example, represents the sum of utility output for each of the categories of economic activity listed in Table A. For repair and maintenance construction office, this figure represents the amount spent times he input/output coefficient showing the total amount of output per $1 million of construction expenditures. The same methodology applies to all the other figures given in Table C. Detailed figures may be found in the tables in Section (8), which provide estimates of employment, output, and household earnings, and output and earnings per new worker, for the 20 major industrial classifications in the RIMS II input/output model.

3. Introduction and Scope of Work

Mona Shah and Associates plans to raise EB-5 funds for the development and operation of a Holiday Inn Express, to be located at 64-06 Queens Blvd, Woodside, NY. The hotel will have 135 rooms and suites. This report contains the economic impact analysis for the hard and soft costs of construction, purchases of FF&E, and hotel operations. The developer will maintain an ownership interest in the hotel, so direct jobs can be counted for that activity.

The calculations are based on the RIMS II input/output model for 23 of the 30 counties in the New York Combined Statistical Area (CSA). This area has already been approved by USCIS for a regional center. These counties are as follows:

1. NYC—New York, Bronx, Richmond, Kings, Queens, Westchester, Rockland
2. Upstate New York Suburbs —Putnam, Dutchess, Orange, Ulster
3. Long Island—Nassau, Suffolk
4. Connecticut—Litchfield, New Haven, Fairfield
5. New Jersey —Bergen, Essex, Hudson, Morris, Passaic, Sussex, Union

Section (4) contains a brief description of the RIMS II models and its various multipliers, and Section (5) contains additional information explaining how the indirect jobs are calculated.

Section (6) contains and analyzes the key statistics for the 23-county area used to calculate the RIMS II multipliers. It is subdivided into five subsections, corresponding to the five groups shown above. Each subsection contains tables showing the following information: (1) data for employment by major occupation and industrial classification, income distribution by deciles, mean and median household and family income, and poverty rates, with these figures compared to the U.S. totals or averages; (2) key labor market statistics over the past decade for each county and the county group total; and (3) level and growth rate of population and personal income for these same areas. Section (7) shows the commuting patterns for New York City, maps of the area, and TEA analysis.

Section (8) presents the economic impact tables for the hard costs, EB-5 eligible soft costs, and purchases of FF&E. Separate sets of tables are presented for each category of construction for the increase in employment, output, and earnings, and the average level of output and earnings per new worker, for the 20 major industrial classifications in the RIMS II input/output model. Section (9) contains similar tables for hotel operations. Section (10) contains the summary tables for the project.

4. Brief Guide to RIMS II Input/Output Model

The following material has been condensed from the RIMS II User Handbook.

Introduction and General Comments

Effective planning for public- and private-sector projects and programs at the State and local levels requires a systematic analysis of the economic impacts of these projects and programs on affected regions. In turn, systematic analysis of economic impacts must account for the inter-industry relationships within regions because these relationships largely determine how regional economies are likely to respond to project and program changes. Thus, regional input-output (I-O) multipliers, which account for inter-industry relationships within regions, are useful tools for conducting regional economic impact analysis.

In the 1970s, the Bureau of Economic Analysis (BEA) developed a method for estimating regional I-O multipliers known as RIMS (Regional Industrial Multiplier System), which was based on the work of Garnick and Drake. In the 1980s, BEA completed an enhancement of RIMS, known as RIMS II (Regional Input-Output Modeling System), and published a handbook for RIMS II users. In 1992, BEA published a second edition of the handbook in which the multipliers were based on more recent data and improved methodology. In 1997, BEA published a third edition of the handbook that provides more detail on the use of the multipliers and the data sources and methods for estimating them.

RIMS II is based on an accounting framework called an I-O table. For each industry, an I-O table shows the industrial distribution of inputs purchased and outputs sold. A typical I-O table in RIMS II is derived mainly from two data sources: BEA's national I-O table, which shows the input and output structure of nearly 500 U.S. industries, and BEA's regional economic accounts, which are used to adjust the national I-O table to show a region's industrial structure and trading patterns.

Using RIMS II for impact analysis has several advantages. RIMS II multipliers can be estimated for any region composed of one or more counties and for any industry, or group of industries, in the national I-O table. The accessibility of the main data sources for RIMS II keeps the cost of estimating regional multipliers relatively low. Empirical tests show that estimates based on relatively expensive surveys and RIMS II-based estimates are similar in magnitude.

BEA's RIMS multipliers can be a cost-effective way for analysts to estimate the economic impacts of changes in a regional economy. However, it is important to keep in mind that, like all economic impact models, RIMS provides approximate order-of-magnitude estimates of impacts. RIMS multipliers are best suited for estimating the impacts of small changes on a regional economy. For some applications, users may want to supplement RIMS estimates with information they gather from the region undergoing the potential change. To use the multipliers for impact analysis effectively,

users must provide geographically and industrially detailed information on the initial changes in output, earnings, or employment that are associated with the project or program under study. The multipliers can then be used to estimate the total impact of the project or program on regional output, earnings, and employment.

RIMS II is widely used in both the public and private sector. In the public sector, for example, the Department of Defense uses RIMS II to estimate the regional impacts of military base closings. State transportation departments use RIMS II to estimate the regional impacts of airport construction and expansion. In the private-sector, analysts and consultants use RIMS II to estimate the regional impacts of a variety of projects, such as the development of shopping malls and sports stadiums.

RIMS II Methodology

RIMS II uses BEA's benchmark and annual I-O tables for the nation. Since a particular region may not contain all the industries found at the national level, some direct input requirements cannot be supplied by that region's industries. Input requirements that are not produced in a study region are identified using BEA's regional economic accounts.

The RIMS II method for estimating regional I-O multipliers can be viewed as a three-step process. In the first step, the producer portion of the national I-O table is made region-specific by using six-digit NAICS location quotients (LQs). The LQs estimate the extent to which input requirements are supplied by firms within the region. RIMS II uses LQs based on two types of data: BEA's personal income data (by place of residence) are used to calculate LQs in the service industries; and BEA's wage-and-salary data (by place of work) are used to calculate LQs in the non-service industries.

In the second step, the household row and the household column from the national I-O table are made region-specific. The household row coefficients, which are derived from the value-added row of the national I-O table, are adjusted to reflect regional earnings leakages resulting from individuals working in the region but residing outside the region. The household column coefficients, which are based on the personal consumption expenditure column of the national I-O table, are adjusted to account for regional consumption leakages stemming from personal taxes and savings. In the last step, the Leontief inversion approach is used to estimate multipliers. This inversion approach produces output, earnings, and employment multipliers, which can be used to trace the impacts of changes in final demand on and indirectly affected industries.

Advantages of RIMS II

There are numerous advantages to using RIMS II. First, the accessibility of the main data sources makes it possible to estimate regional multipliers without conducting relatively expensive surveys. Second, the level of industrial detail used in RIMS II helps avoid aggregation errors, which often occur when industries are combined. Third, RIMS II multipliers can be compared across areas because they are based on a consistent set

of estimating procedures nationwide. Fourth, RIMS II multipliers are updated to reflect the most recent local-area wage-and-salary and personal income data.

Overview of Different Multipliers

RIMS II provides users with five types of multipliers: final demand multipliers for output, for earnings, and for employment; and direct-effect multipliers for earnings and for employment. These multipliers measure the economic impact of a change in final demand, in earnings, or in employment on a region's economy.

The final demand multipliers for output are the basic multipliers from which all other RIMS II multipliers are derived. In this table, each column entry indicates the change in output in each row industry that results from a $1 change in final demand in the column industry. The impact on each row industry is calculated by multiplying the final demand change in the column industry by the multiplier for each row. The total impact on regional output is calculated by multiplying the final demand change in the column industry by the sum of all the multipliers for each row except the household row.

RIMS II provides two types of multipliers for estimating the impacts of changes on earnings: final demand multipliers and direct effect multipliers. These multipliers are derived from the table of final demand output multipliers.

The final demand multipliers for earnings can be used if data on final demand changes are available. In the final demand earnings multiplier table, each column entry indicates the change in earnings in each row industry that results from a $1 change in final demand in the column industry. The impact on each row industry is calculated by multiplying the final demand change in the column industry by the multipliers for each row. The total impact on regional earnings is calculated by multiplying the final demand change in the column industry by the sum of the multipliers for each row.

Employment Multipliers

RIMS II provides two types of multipliers for estimating the impacts of changes on employment: final demand multipliers and direct effect multipliers. These multipliers are derived from the table of final demand output multipliers.

The final demand multipliers for employment can be used if the data on final demand changes are available. In the final demand employment multiplier table, each column entry indicates the change in employment in each row industry that results from a $1 million change in final demand in the column industry. The impact on each row industry is calculated by multiplying the final demand change in the column industry by the multiplier for each row. The total impact on regional employment is calculated by multiplying the final demand change in the column industry by the sum of the multipliers for each row.

The direct effect multipliers for employment can be used if the data on the initial changes in employment by industry are available. In the direct effect employment multiplier table, each entry indicates the total change in employment in the region that results from a change of one job in the row industry. The total impact on regional employment is calculated by multiplying the initial change in employment in the row industry by the multiplier for the row.

Choosing a Multiplier

The choice of multiplier for estimating the impact of a project on output, earnings, and employment depends on the availability of estimates of the initial changes in final demand, earnings, and employment. If the estimates of the initial changes in all three measures are available, the RIMS II user can select any of the RIMS II multipliers. In theory, all the impact estimates should be consistent. If the available estimates are limited to initial changes in final demand, the user can select a final demand multiplier for impact estimation. If the available estimates are limited to initial changes in earnings or employment, the user can select a direct effect multiplier.

5. Methodology for Calculating Indirect Job Gains

In spite of the explanation of the RIMS II model given directly above, some USCIS adjudicators have asked for further clarification about how that model is used to determine the increase in the number of indirect jobs. That is an important issue because, unlike the direct job count, which can be verified by USCIS from various payroll and withholding documents, the calculation of indirect jobs cannot be verified directly but depends on mathematical calculations.

The general concept is based on the coefficients in the input/output model itself (the same methodology applies to RIMS II, IMPLAN, or any other generally recognized and accepted input/output model). In any given year, the government calculates how much input is used for a given production of output. The detailed figures are taken from the Economic Censuses taken once every five years; the figures are then updated from various annual supplements.

Basically the process has two steps, each of which is described next in greater detail. The first is to determine the amount of output, and hence the number of jobs, required to produce a given amount (say $1 million) of the final product or service. These are national coefficients. The second is to determine what proportion of those goods and services are purchased within the local region (the regional purchase coefficients, or RPCs).

In the case of a manufacturing process, the national coefficients are based on production functions: how much coke per ton of steel, how much steel per motor vehicle, how much flour for a loaf of bread, and so on. However, most of the jobs are created in the service sector, where Commerce Department data are used to determine, for example, how much restaurants spend on laundry services, how much airlines

spend for attorneys, and so on. These figures are based on information contained in the various Economic Censuses. The national coefficients would also determine, for example, how many architects and engineers would be hired for a construction project of a given scope and size, and how many new employees at financial institutions would be required to handle the additional cash flow generated by the new business. Both of these are discussed below in greater detail.

Even after these coefficients are determined, however, the regional purchase coefficients (RPC) must still be estimated. If, for example, a trucking firm spends 1% of its revenue on accountants, how much of that money is spent on local firms, and how much is spent outside the region?

That answer depends on various factors. The most important is the amount of the good or service produced within the region. If a trucking firm, for example, were located in a small county with no accountants, obviously it would not spend any of that money locally. That sets a lower limit but is not generally the case. Instead, a balancing algorithm is used.

Suppose, for example, that all the firms producing, distributing, or selling goods and services in a given county spent $10 million on accounting services. Also, suppose that total billings of all accountants in the county were $20 million. In that case, local accountants could handle all the local business, plus business from neighboring counties. If, on the other hand, total accountant billings in the county were only $5 million, local firms could not spend more than half of the money on local accountants.

Of course it is possible that there are adequate resources in the county but local firms choose to use companies outside the county; perhaps prices or service is better. No input/output model can account for such anomalies. On the other hand, given transportation costs, it would be highly unusual for a firm to be located in a given location and not serve the nearby businesses, instead choosing only those clients who were farther away.

The RIMS II model – and other regional input/output models – assigns regional purchase coefficients (RPCs) in all cases where the local industry purchases goods and services from local firms. This matrix could have as many as 406 * 406 = 164,836 elements, although in practice many of them are zero. Large counties with a wide variety of businesses have more non-zero elements than small counties with relatively few businesses.

In general, the RPCs tend to be close to zero for most manufactured goods, and close to unity for most services. While there are many exceptions to this rule, most firms will use financial, professional, business, and health care services that are located in that county or contiguous areas.

To take just one example of many, consider the number of new jobs created by architects and engineers for a new construction project of any given size. Most construction cost manuals, such as those published by R. S. Means, indicate that those

costs are usually about 5% to 9% of the total job. According to the national input/output file, the figures are 9.2% for commercial construction and 4.5% for industrial construction.

To summarize to this point, the number of indirect jobs as a proportion of direct jobs depends on (a) the national relationships, and (b) the regional purchase coefficients. In our presentation for the businesses in this report, we provide further discussion of those industries with the largest number of indirect jobs. However, there are a few industries that produce relatively large numbers of jobs in almost all cases, and these can be generally discussed at this stage in order to avoid repeating this information several times. The industries discussed here include banking, real estate, legal and accounting, architects and engineers, other professional services, employment services, other business services, restaurants, and government. In all of these cases, the vast majority of workers are hired locally. Our comments for the rest of this section are based on the assumption of a $10 million investment; the results are linear.

Banking and credit: On an aggregate basis, for every $10 million in deposits, very broadly defined (M3), there is about 1 new banking employee. As a rough rule of thumb, the size of M3 is roughly equal to the size of GDP. Hence we would expect about 1 new banking employee for every $10 million increase in output, as calculated from the RIMS II model.

Real estate: Additional real estate employees are based on two factors. One is the leasing activity of the new building, and the other is the increase in residential real estate activity as people get new jobs, either within the area or by moving into the area. On a lease basis, a $10 million investment is likely to result in a building of 80,000 square feet. If it leases for $40/square foot, that would be $3.2 million in annual lease payments, and with a 6% commission would generate $192,000 in revenues, which would account for about 2 new real estate employees (the figure would be less for industrial buildings). The increase in employment would also result in some real estate activity as workers moved into better housing in the same location, or moved in from other areas. In a normal year, there are about 7 million sales of new and existing homes for a labor force of about 140 million, or 5%. Hence if the total increase in employment were 200, that would imply 10 real estate transactions; if they average $200,000 at a 6% commission, that would be $12,000 per home or a total of $120,000, which would support approximately 1 new real estate job.

Legal & Accounting: Each of these accounts for about 1% of total employment; so if there were a total increase of 200 jobs, we would expect an average of 4 new employees in this classification.

Architects & Engineers: almost all of these jobs stem from the new construction activity. This category has already been discussed above; for a $10 million construction project, which would create about 80 new construction jobs, we would expect about 7 new jobs in architects and engineers for a commercial project and 3 to 4 new jobs for an industrial project.

Other professional services: This category includes employees in consulting, scientific research and development, advertising, and management, as well as several other smaller, specialized categories. In general, consulting, management, and the all other category each account for about 1% of total employment, and R&D and advertising account for about ½% of total employment, for a total of about 4% of total employment. This figure will vary widely depending on the degree to which consultants and R&D are used by the new business.

Employment services: On a national average basis, 1 out of every 45 people is employed by this industry. Here again, the figures will vary widely depending on (a) the proportion of people who are hired through employment agencies, and (b) the proportion of the work that is outsourced to employment services.

Business support services include office management, travel arrangement, security, credit bureaus, telemarketing, and back-office jobs that are outsourced, such as direct mail, copying, and duplicating services. The back-office services would vary widely depending on the type of new business; retail stores, for example, would print and distribute more advertising brochures than a manufacturing operation. On a national average basis, these jobs account for about 2% of total employment.

Building support services, which includes janitorial services, lawn maintenance, and waste management. For an office building of 80,000 square feet, the cost would be approximately $2/sq ft per year for maintenance, or $160,000, which would support about 4 new jobs; here again, the figure would be lower for industrial buildings.

Restaurants: This category reflects business meals. Of course the number of business meals depends greatly on the type of business; lawyers, accountants, and consultants will have more business meals than manufacturing plants or water treatment facilities. On a national average basis, Commerce Department figures show that total restaurant sales in 2007 were $580 billion, while consumer expenditures at restaurants were $500 billion. However, that figure also includes tips, which are not included in restaurant sales. After subtracting 15% for tips, that indicates about $425 billion in food and beverage purchases by consumers, indicating about $155 billion for business expenses. With a labor force of approximately 140 million, that is equivalent to about $1,100 per employee. Hence if 200 new jobs were created, business meal expenses would rise an average of $221,000, which would imply about 4.5 new indirect jobs in the restaurant industry. These figures are likely to be somewhat higher when direct jobs are created for office buildings and hotels.

Government: The increase in public sector employees represents the amount funded by increased real estate taxes. For a construction project with $10 million in hard costs, the total value is likely to be between $15 and $20 million when one includes furniture, fixtures, equipment, and land values. Using a national average property tax rate of 1%, that would raise $150,000 to $200,000, which would create 1 to 2 new jobs in the public sector.

6. Economic Parameters for 23 Counties in the New York Metropolitan Area

This section contains information about employment, income distribution, labor market parameters, the level and growth rate of population and personal income, and commuting patterns around New York City for 23 counties in the New York metropolitan area. This list is similar to, although not exactly the same as the NYC metro area as defined by Census, but it is smaller than the Consolidated Statistical Area or the BEA Economic Area for NYC. For ease of exposition we have divided the tables, commentary, and analysis into the five sub-groups. These subgroups are as follows:

A. NYC and Nearby Northern Suburbs — New York, Bronx, Richmond, Kings, Queens, Westchester, and Rockland
B. Upstate New York—Putnam, Dutchess, Orange, Ulster
C. Long Island—Nassau, Suffolk
D. New Jersey North—Bergen, Essex, Hudson, Morris, Passaic, Sussex, Union
E. Connecticut—Litchfield, New Haven, Fairfield

The analysis thus proceeds as follows. For each of these 5 subgroups, the following tables are presented:

1. Employment by major industrial classification, income distribution by household and families, mean and median levels of income and poverty rates. In general, there are 2 to 3 counties in each table, so there are anywhere from 1 to 4 tables for each subgroup in this category.

2. Labor market statistics: size of labor force, number of employed and unemployed, and unemployment rate

3. Level and growth rate of population

4. Level and growth rate of personal income

Group A. New York, Bronx, Kings, Queens, Richmond, Westchester, and Rockland Counties

Table 6-1. Key Economic Statistics for Kings and Queens Counties Compared to the U. S. Economy, 2013 Data

PERCENTAGE BELOW POVERTY LEVEL						
All families	19.5%	168.1%	12.3%	106.0%	11.6%	
All people	23.3%	147.5%	15.3%	96.8%	15.8%	

Note that in these and succeeding tables, the figures in the percentage column in black refer to the group total, whereas the figures in red refer to the U. S. averages

Relative to the U.S., Queens County has a higher than average proportion of the workforce in transportation, representing the two airports; and also in financial services,

entertainment and leisure, and other private services. The major shortfall is in manufacturing, with only 4.5% of the workforce engaged, compared to 10.5% nationally.

In terms of income distribution, Queens is the quintessential "middle class" county, with median and mean household and family income narrowly straddling the national average; the average of the median household and family income is 3% higher, while the average of the mean household and family income is 3% below the average. Also, the poverty rate for all families is 106% of the national average, while the rate for all people is 97% of that average. The income distribution is also very similar to the national average.

The occupational distribution in Kings County is similar in many ways to Queens except that there are proportionately more employees in health care and information services, which includes newspapers, the Internet, and movie production. It also has a higher proportion in professional services, reflecting the large number of professionals who live "across the bridge" in Brooklyn. The proportions are lower than Queens and the U.S. for manufacturing and wholesale and retail trade; they are lower than Queens but higher than the U.S. average for transportation and other private services.

While Kings County has close to the average proportion of individuals and families in the upper income brackets, it has far more than average in the lower brackets. As a result, the poverty rate is well above the national average, at 168% for all families and 148% for all people. The larger proportions at the lower end of the income scale means that while all broad-based levels of income are below average, the figures are lower for median incomes than for mean incomes.

Median earnings for workers	51,527	169.2%	25,385	83.4%	30,454	
Median earnings for male full-time	82,087	170.7%	35,637	74.1%	48,099	
Median earnings for female full-time	65,369	171.6%	35,989	94.5%	38,097	
PERCENTAGE BELOW POVERTY LEVEL						
All families	14.8%	127.6%	27.6%	237.9%	11.6%	
All people	18.9%	119.6%	30.9%	195.6%	15.8%	

It is not surprising to find that in New York County (Manhattan), the proportion of the workforce engaged in financial services is more than twice the national average, standing at 16.7% compared to 6.6% nationally. Similarly, the proportion of the workforce in professional and administrative services is 19.6%, compared to 11.1% nationally, and the proportion in information services is 6.4%, compared to 2.1% nationally. Offsetting these sharp divergences on the positive side, there are a far smaller proportion of workers in construction, manufacturing, retail trade, and transportation services.

New York County has the greatest skewed income distribution of any county at the upper end, with 25.4% of families with incomes of over $200,000, compared to 6.5% nationally. As a result, mean family income is 207% of the national average; median family income is a far more moderate 138% of the average. However, there are also a higher than average proportion of households and families in the two lowest income brackets, with the result that the poverty levels are above average, at 128% of the national average for all families and 120% for all people. The "fat tails" of the income distribution at both ends leads to a shortfall in the middle of the distribution, with only 10.4% of the families with income between $50,000 and $75,000 per year, compared to 19% nationally.

The stark comparison between New York and Bronx counties can be seen by noting that whereas 25.4% of the families in New York County have incomes of over $200,000, the figure is only 2.1% for the Bronx. The Bronx also has a preponderance of households and families in the lower income brackets, with the result that the poverty rates are twice the national average. In terms of occupational distribution, nearly one-third of the workforce is employed in education and health care services, compared to 23% nationally; the major shortfall is in manufacturing.

Richmond County (Staten Island) has a disproportionately high share of its workforce in health care, finance, and public administration; this is offset by lower than average shares in manufacturing and leisure. Median household and family income levels are 33% above the comparable national figures; mean income levels are about 22% higher. Richmond County has 27.8% of the workforce in education and healthcare services, compared to 23.0% nationally, which is largely offset by only 2.4% in manufacturing, compared to 10.5% nationally.

Westchester County is a very affluent, white-collar suburban county; 46.6% of its workforce is in management and professional jobs, compared to 36.3% for the nation, while only 7.9% work in production and transportation, versus 12.2% nationally. Median income levels are 61% to 64% above the national figures, with mean income levels are 77 to 82% higher. Consistent with this, 21.7% of the families in Westchester County earn over $200,000 per year, well above the U.S. average of 6.5%.

Rockland County is to the west of Westchester, and while the section of Rockland County that is closest to Westchester – and the Hudson River – maintains the same upscale characteristics, the western part of the county has a much lower level of income and higher incidence of poverty. Hence we find that mean family income is 153% of the national average, compared to over 182% in Westchester, and the poverty rate for all families is 91%, compared to 62%.

In terms of employment distribution, the proportion of workers in most sectors is close to the national average except for education and health care services, which employ 32.4% of the workforce, compared to 23.0% nationally. Offsetting that, the proportions in other industry sectors except construction are all slightly lower, with the biggest decrement occurring in manufacturing.

New York City and the close-in suburbs were not particularly hard hit by the financial collapse in spite of Wall Street being the epicenter of that meltdown. However, the unemployment rate in the 7-county region rose only to 9.0% in 2009 and 9.2% in 2010, compared to 9.3% and 9.6% nationally; it then fell to 8.8% in 2011, which was also slightly below the 8.9% national average rate. However, it then took a surprising jump up in 2012, when the rest of the economy continued to improve; the 7-county average rose from 8.8% to 9.1%, with a rise in each county in this group. The rate then fell proportionately with the national average in 2013 and 2014. The unemployment rate in the Bronx remained high at 9.8% in 2014, however, meaning that the entire county qualified as a TEA.

Population growth in New York City was quite sluggish over the past decade, but starting in 2008 has picked up sharply, with growth rates for the past six years averaging about 0.8%, only slightly less than the 0.93% national average growth rate. Growth peaked in 2011, as it slightly exceeded the national average, although it has backed off slightly. However, growth in Kings and Queens has remained strong throughout 2013, due in part to increased immigration and in part to the overall strength bolstered by the recovery in the stock market. For the next few years, population growth for this 7-county area will probably remain close to, but slightly below, the expected national average gain of about 0.9% per year.

The financial meltdown in New York City put a huge dent in Manhattan income in 2009, but the city bounced back quickly the following year, with the 2010 gain exceeding the 2009 loss; for the overall economy, the percentage increase in personal income in 2010 was the same as the decline in 2009. Growth also remained strong in 2011 and 2012, but then showed almost no gain in 2013, with sharp declines in each of the 7 counties listed above except the Bronx, which failed to share in the 2012 gains. This slowdown occurred even though the stock market rose 30% in 2013; however, financial institution profits were hurt by a variety of other factors, including fewer mega-mergers, foreign weakness, and continuing attacks on bank profits through various Federal lawsuits and Dodd-Frank legislation designed to curb trading excesses. As a result, many bonuses were smaller, and hence the growth in income was curtailed.

Group B. Dutchess, Putnam, Orange, and Ulster Counties

Median earnings for female full-time	46,606	122.3%	48,150	126.4%	38,097	
PERCENTAGE BELOW POVERTY LEVEL						
All families	5.9%	50.9%	3.2%	27.6%	11.6%	
All people	9.1%	57.6%	4.4%	27.8%	15.8%	

Both these counties are directly north of Westchester, but while Putnam County, which directly borders on Westchester, is essentially a continuation of upscale suburban living, the income levels in Dutchess County are more moderate although still above average. Thus median family income in Putnam is 160% of the national average, compared to 140% for Dutchess. Similarly, the poverty rate for all families is an exceptionally low 28% for Putnam, compared to 51% for Dutchess County.

For the employment distribution by industry, Putnam County is very similar to Westchester, with a preponderance of employees in financial and professional services,

and a very small manufacturing sector. Dutchess County, on the other hand, has more manufacturing and a below-average proportion of employment in those service industries. Relative to national average figures, the biggest bulge in employment in that county occurs in education and health care.

Orange and Ulster counties are more exurban or rural counties, and have less in common with the big city, although they still supply significant numbers of commuters. The income levels are moderately above the national averages, with mean and median household and family incomes averaging 128% of national levels for Orange County

and a somewhat less impressive 113% for Ulster County. However, the poverty rates in Ulster County are slightly lower than in Orange County, as there are fewer rich and poor people in Ulster.

The employment profile for the two counties is fairly similar, with a smaller than average proportion of the workforce in manufacturing, financial services, and professional services, and a higher than average proportion in education and health care. The only major difference is Ulster County has a higher than average proportion of workers in arts, entertainment and leisure, while the proportion is below average for Orange County.

This part of New York State was fairly well insulated from the collapse of the financial sector in late 2008 and was not particularly hard hit by the recession. The unemployment rate for the 4-county region rose to 7.6% in 2009 and 7.8% in 2010 before declining moderately to 7.6% in 2011, but these figures were below the 9.3%, 9.6% and 9.0% figures for the overall U. S. economy. Similar to the pattern for New York City, the unemployment rate for this 4-county region then took an upward bump to 7.9% in 2011 before declining sharply to 6.8% in 2013 and 5.4% in 2014

Unlike the growth rate in the 7-county area described above, population growth in these 4 counties tailed off in latter half of the previous decade and then failed to improve at all, with anemic growth rates of 0.2% in 2011 and 2012 followed by an actual decline of 0.2% in 2013; the slump occurred in all four counties. Exurban living lost some of its charms, and tourism to these counties also suffered as cheaper airfares led to more exotic vacation preferences.

Table 6-12. Level and Growth Rate of Personal Income, Billions of Dollars, 4 Upstate New York Counties, and the Total of these Counties

	Dutchess	Orange	Putnam	Ulster	4 counties
2013	14.74	16.45	5.87	8.06	30.38

2010/09	1.87%	2.88%	1.56%	4.29%	2.99%
2009/08	-1.68%	0.25%	-3.99%	-0.28%	-0.75%
2008/07	3.41%	4.20%	2.47%	5.64%	4.21%
2007/06	6.58%	6.25%	7.92%	5.87%	6.49%
2006/05	6.89%	5.62%	7.51%	7.94%	6.59%
2005/04	6.98%	5.07%	4.66%	6.34%	5.31%
2013/04	3.77%	3.67%	3.26%	4.29%	3.75%

The decline in income in 2009 due to the financial plunge was not very serious for these counties, but the rebound was not very robust either, and by 2013, growth in income had also come to a halt, in line with the declining population.

Nassau County is another wealthy suburban county of New York City, but the figures are not quite as affluent as for Manhattan (at the upper end) or Westchester. Thus median family income is 175% of the national average, but mean income is a slightly lower 165%, as the income distribution is not as skewed as in Manhattan. The poverty rates are quite low, at 38% for all families and all people. Employment in information, financial, and professional and administrative services are all well above average, while the proportions for manufacturing, and for entertainment and leisure, are below average.

Residents of Suffolk County are not quite as affluent as their neighbors in Nassau County, as mean and median income levels are about 21 percentage points below the Nassau figures in all cases. The distribution of the workforce is quite similar to the national averages, with deviations only in construction (7.7% vs. 6.2% for the U.S.), manufacturing (7.6% vs. 10.5%), and leisure and entertainment (6.9% vs. 9.7%).

2014	766,711	725,918	40,793	5.3

As was generally the case for the New York City suburbs, unemployment rose moderately in the recession but remained well below the national averages. The one anomaly here is that unemployment in Suffolk County inched higher in 2010 as the rest of the economy recovered, but it then fell in line with national averages in 2011. Both counties then posted a 0.2% gain before falling sharply in 2013 and 2014, with the Nassau unemployment rate down from 7.0% to 5.9% and 4.8%; and the Suffolk unemployment rate down from 7.8% to 6.5% and 5.3% in 2013 and 2014 respectively.

2005/04	-0.13%	0.50%	0.20%
2013/04	0.08%	0.21%	0.15%

In the previous section we noted that the northern counties lost population in 2013 as the charms of exurban living diminished. The same pattern is seen here, with Suffolk County losing population in 2013, while Nassau County posted a 0.25% gain, anemic relative to the nation but about par for the overall region.

Table 6-16. Level and Growth Rate of Personal Income (Billion $), 2 Long Island Counties and the Total of These Counties

	Nassau	Suffolk	2 counties
2013	98.10	85.40	183.49

2008/07	2.82%	1.67%	2.29%

2007/06	6.21%	8.03%	7.04%
2006/05	6.83%	7.85%	7.30%
2005/04	8.41%	6.78%	7.66%
2013/04	3.56%	3.72%	3.64%

Growth in personal income in these two counties did far better than the national average through 2007 in spite of a decline in population, but that boom came to an abrupt end during the recession. Since then, the percentage increase in personal income has averaged slightly less than 3%, compared to 3.5% for the national economy. Given the lack of any growth in population, the increase in personal income is also likely to remain below average.

The income distributions in Essex and Hudson Counties can best be described as "fat-tailed", with greater than average percentages in the highest and lowest income brackets. To elaborate, 10% of families in each of the two counties earn less than $15,000 a year, compared to 8% nationally – while 12% of Essex families and 9% of Hudson families earn $200,000 or more, compared to 6.5% for the U.S. This dichotomy can also be seen in the high mean family incomes ($104,300 in Essex and $88,600 in Hudson, versus $86,000 for the U.S.) and large share of families living in poverty (14.2% in Essex and 16.8% in Hudson County, versus 11.6% for the nation).

Turning to the occupation data, both counties have lower than average shares in manufacturing as well as the arts, entertainment, hotel, and food service industries – and higher than average shares in transportation and finance. The counties differ in the mix of workers in the education and health care industries, as Essex (26.1%) has a higher proportion than average and Hudson has a lower proportion at 18.9%.

Bergen and Morris counties are two of the more affluent counties in New Jersey; mean household and family income levels are 56% above the national figures in Bergen County and 89% above the national figures in Morris County. Along the same lines, the poverty rates in both counties are quite low, at 55% for Bergen County and an unusually low 25% for Morris County.

Consistent with its high-income profile, about half of the workforce is in management and professional jobs – 48% in Bergen and 50% in Morris, well above the national percentage of 36.3%. On the other side of the coin, each county has a smaller mix of workers in service occupations and production and transportation compared to the rest of the nation.

All people	16.6%	105.1%	5.8%	36.7%	15.8%

While both of these are suburban counties in Northern New Jersey, Passaic has significant pockets of poverty, pushing the poverty rate for all families to 121% of the national average even though median and mean household and family income are slightly higher than average. On the other hand, Sussex County has median household and family income that are 169% and 155% of the national average, although the mean income figures are somewhat lower at 143% and 134%; these above-average figures are accompanied by poverty rates that are 39% and 37% of the national level for all families and all people respectively.

The proportions of employment by major industrial sector are generally close to national averages except that manufacturing is higher in both counties, and arts, entertainment and leisure is below average.

PERCENTAGE BELOW POVERTY LEVEL				
All families	8.9%	76.7%	11.6%	
All people	11.5%	72.8%	15.8%	

Mean household and family income levels in Union County are about one-third higher than the national averages; however, median earnings for male full-time workers ($53,600) are only about 11% higher than the comparable U.S. figure ($48,100). Poverty rates in Union County for both families and households are about 25% lower than the national rates.

The mix of occupations in Union County is relatively similar to the U.S., with slightly more workers in wholesale trade, transportation, information, and finance – and slightly fewer in mining, retail, education, health care, and hospitality.

On balance, the unemployment rate for these 7 counties in Northern New Jersey is close to the national average, but there are significant differences among individual counties. In 2014, Essex (Newark), Hudson (Jersey City) Passaic (Patterson) and Union (Elizabeth) all had unemployment rates well above average, with rates of 7.9%, 6.5%, 8.1% and 6.8% respectively. On the other hand, the unemployment rates in Bergen and Morris Counties were 5.4% and 4.9%, compared to 6.2% nationally.

In terms of population growth, this is a sluggish section of both the overall economy and the NYC metropolitan area, with average annual growth of only 0.33%. Even so, the population growth follows the pattern for New York City; an actual decline or very sluggish growth in the first half of the previous decade, followed by a significant improvement starting in 2009. The most impressive increase has occurred in Hudson County, as many financial firms move some of their operations across the river to Jersey City. On the other hand, population growth in Morris County has declined, and it has remained negative in Sussex County, once again reinforcing the decline in population in exurban counties in the New York City area.

The growth in income for these 7 counties was well below the national and metropolitan average. The more rapid growth in population in Hudson County was also reflected in the growth in income, due to the expansion of jobs in the financial services area. Sussex County posted the lowest growth rates over the decade, reflecting the actual decline in population, while growth in Essex, Morris, and Union counties were all well below average.

Please note that in these tables, the percentage figures in regular type refer to the overall category in that column, while the figures in red are relative to the U.S. average figures

Fairfield County is sometimes considered the quintessential bedroom community for New York City, and has unusually high incomes. Besides being the home of many wealthy communities, a burgeoning venture capital and hedge fund industry has grown up around Greenwich and Stamford, although it took a severe hit in 2009. Still, there are 3.6 times as many households and families in the top income bracket as is the case nationally. As a result, while median family income is 159% of the national average, mean income is even higher, at 190%; the figures are roughly the same for household income. The poverty rate for families is only about half the national average rate; but there are substantial pockets of poverty in Bridgeport, so the poverty rate is somewhat higher than would ordinarily be expected with such a high a mean income.

In terms of employment by major industry sector, the financial sector scores very strongly, with 11.5% of the workforce, compared to 6.6% nationally. The county also has a relatively robust manufacturing sector, employing 8.7% of the workforce, although

it fell off sharply during the recession and is now significantly below the 10.5% national average. There are also higher than average proportions of the workforce in information, and in professional services. Offsetting these, there are fewer than average workers in tourism and leisure, and public administration.

The economy of New Haven is dominated by Yale University, as can be seen by the 31.4% of the workforce in education and health care services, compared to 23.0% nationally. Except for that, however, the economy of the rest of the county is not in particularly good shape. There are substantial pockets of poverty scattered throughout the county, which brings the poverty rate for all families up to 82% of the national average; and mean family income is a relatively modest 116% of the national average.

Besides the bulge in employment in educational services, there are proportionately more than the average number in manufacturing, at 11.0% of the workforce, compared to 10.5% nationally. Most of the other industry groups have fewer than proportional numbers of employees, particularly tourism and leisure.

Litchfield County is perhaps best known for the upscale community of Litchfield, where many wealthy New Yorkers have second homes. However, that represents only a small proportion of the total economic activity, and the rest of the county has only average levels of income. These second-residencers do not bring much to the economy of the county, and most of them have their primary homes elsewhere, so the income figures are not strongly tilted up by these households. In terms of the workforce, the higher than average proportions occur in manufacturing, 14.0% compared to 10.5% nationally, and education and health care, 27.8% compared to 23.0%. By comparison, the proportion of the workforce in tourism and leisure is only 8.0% compared to 9.7% nationally in spite of all those vacationing New Yorkers.

As noted above, there are very few poor people in Litchfield County, so the poverty rate for families is only 35% of the national average, compared to 59% for Fairfield County. There are enough upscale residents to push median household and family income to 136% of the national average; but in sharp contrast with Fairfield County, the mean income figures are about 12% below these levels instead of being substantially higher.

In the 2001 recession, the unemployment rate in Fairfield County rose only to 5%, but in the more recent recession, Wall Street was harder hit, and that rate rose to 8.4%; however, that was the lowest in the three-county area and well below the 9.6% national average. The unemployment rate in Litchfield County rose to 8.6%, while New Haven was harder hit at 10.0%, well above the national average. Yale did not lay anyone off but they did reduce the breakfast portions for the students. The rest of the county was harder hit by the manufacturing slump. Recently, the unemployment rate in these three counties has declined during the recovery, but the reduction has been only from 9.1% to 6.6%, compared to a drop from 9.6% to 6.2% in the national economy from 2010 to 2014

Population growth in both the state of Connecticut and this three-county area remained sluggish over the past decade, with growth rates only about 1/3 of the national average. However, there were substantial differences in the individual county patterns. Fairfield County continued to post respectable, if somewhat below-average, increases in population, as hedge funds and other boutique financial organizations continued to thrive (as opposed to the problems encountered by big banks). New Haven and Litchfield County, on the other hand, suffered from the exurban pattern seen throughout this section for other counties in the area, with Litchfield County posting an actual decline in population ever since the recession.

Table 6-28. Level and Growth Rate of Personal Income (Billion $), 3 Connecticut Counties in the NYC Area, and the Total of these Counties

	Fairfield	Litchfield	New Haven	3 counties
2013	77.08	10.61	44.57	132.26

2008/07	-0.92%	2.44%	2.71%	0.55%
2007/06	4.70%	6.72%	6.86%	5.56%
2006/05	9.89%	8.03%	6.42%	8.59%
2005/04	6.55%	4.38%	3.90%	5.48%
2013/04	3.29%	3.17%	3.30%	3.28%

It does not come as any surprise that personal income in Fairfield County nosedived in 2009 along with the financial crash, with a drop almost double the national average rate; Litchfield was also hard hit, as the residents depend on the summer traffic to boost their incomes. However, even excluding 2009, the growth in personal income was below average; strong growth through 2007 disappeared and did not return. For the decade-long averages, all three counties have had almost identical growth rates in income, but Fairfield County has far outpaced the other two counties in recent years.

7. Commuting Patterns, Maps of Area, and TEA Analysis

We now turn to the commuting patterns in this area. In determining the economic impact of new job creation, it is necessary to choose the counties that form the relevant area for analysis. The economic multipliers will be higher as the number of counties included in the area increases. Hence the commuting patterns of the workforce data from the 2006-10 American Community Survey are used to determine the optimal mix of counties to be included in the multiplier calculations. These commuters spend most of their paychecks in the counties where they live, so the economic impact of the new project creates some new induced jobs in bordering counties. Also, some of the goods and services purchased by the new businesses are produced or purchased from establishments in neighboring counties.

The following list includes all the counties included in the New York City metropolitan area, according to the latest figures available from the Census website.

35620 New York-Northern New Jersey-Long Island, NY-NJ-PA Metropolitan Statistical Area Principal Cities: New York, NY; Newark, NJ; Edison, NJ; White Plains, NY; Wayne, NJ; Union, NJ; New Brunswick, NJ

20764 Edison-New Brunswick, NJ Metropolitan Division *Middlesex County*, *Monmouth County*, *Ocean County*, *Somerset County* 35004 Nassau-Suffolk, NY Metropolitan Division *Nassau County*, *Suffolk County*

35084 Newark-Union, NJ-PA Metropolitan Division *Essex County, NJ*; *Hunterdon County, NJ*; *Morris County, NJ*; *Sussex County, NJ*; *Union County, NJ*; Pike County, PA

35644 New York-White Plains-Wayne, NY-NJ Metropolitan Division *Bergen County, NJ*; *Hudson County, NJ*; *Passaic County, NJ*; *Bronx County, NY*; *Kings County, NY*; *New York County, NY*; *Putnam County, NY*; *Queens County, NY*; *Richmond County, NY*; *Rockland County, NY*; *Westchester County, NY*

The figures shown below are based on the commuting patterns for New York County (Manhattan) and Queens County. Commuting figures for other counties would show different patterns, but in general, these figures indicate that the large New York City metropolitan area not only covers the counties in this report, but additional counties that have not been included in our calculations because of their more tenuous nature to the overall region. In Table 7-1, the first column shows the county where people live who work in New York County; the second column shows the number of people working in New York County. For example, 696,081 people live and work in New York County; 391,008 live in Kings County but work in New York County, and so on; these 23 counties include 94.9% of the New York County workforce. For Queens County, as shown in Table 7-2, the total workforce is 678,019, so these 23 counties include 97.9% of the Queens County workforce.

Table 7-1. Commuting Patterns for New York County, NY

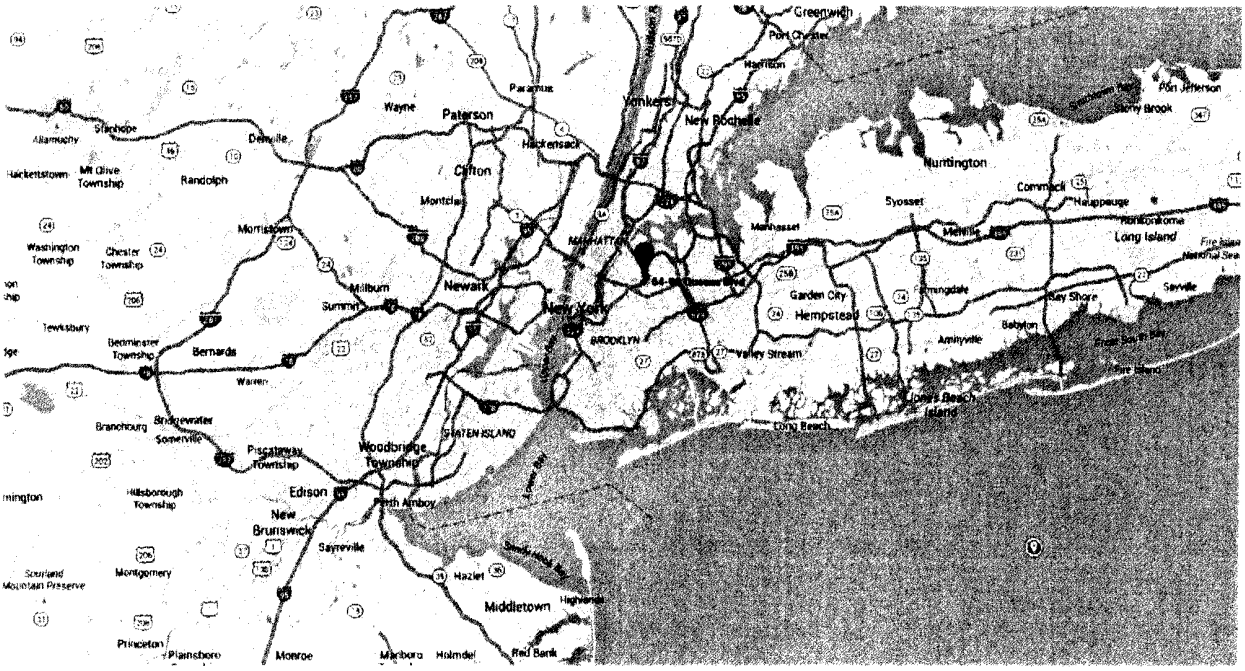
Figures 7-1 and 7-2 show the location of the new building. Figure 7-3 shows Census Tracts near the building; the TEA certification letter from the State of New York will be added when it becomes available. Figure 7-4 shows the map of the New York Consolidated Statistical Area.

Figure 7-1. Location of Building at 64-06 Queens Blvd, Woodside, NY

Figure 7-2. Location of Building in the NYC Metropolitan Area



The building is located in Census Tract (CT) 245 in Queens County. When combined with contiguous CTs, a TEA can be formed with an unemployment rate of at least 9.3% in 2014, based on the Census Share method of calculation. A letter of certification from the Empire State Development Agency of New York State will attest to this finding and will be added to the report when it is received.

NEW YORK STATE OF OPPORTUNITY

New York State
Department
of Economic
Development

August 20, 2015

Mr. Hassan Mokaddam
Paralegal
Mona Shah & Associates, PLLC
299 Broadway, Suite 1005
New York, New York 10007

Dear Mr. Mokaddam:

Attached is a letter from Mr. Joseph Nardone, of the New York State Department of Labor, identifying an area including census tract 245 in Queens County. Based on 2014 annual average labor force data, the Department of Labor has determined that this area meets the minimum threshold of unemployment to qualify as a Targeted Employment Area.

Based on the Labor Department's determination, I am able to certify that the area described in the attached letter qualifies as a Targeted Employment Area.

Census tract 245, in Queens County, contains the address, 64-06 Queens Blvd., Queens, New York 11377

Please feel free to contact me if you have any questions.

Sincerely,

Ms. Kay Alison Wilkie
Economic Development Program Administrator

August 19, 2015

Kay Alison Wilkie
Director for International Policy
Division of Business Advocacy and Research
Empire State Development | NYS Department of Economic Development
625 Broadway
Albany, NY 12245

Dear Ms. Wilkie:

The 2014 average unemployment rate for census tract 245 in Queens County that contains the address, 64-06 Queens Blvd., Queens, NY 11377, as you requested is 9.6 percent. The current minimum threshold to qualify as a Targeted Employment Area is 9.3 percent.

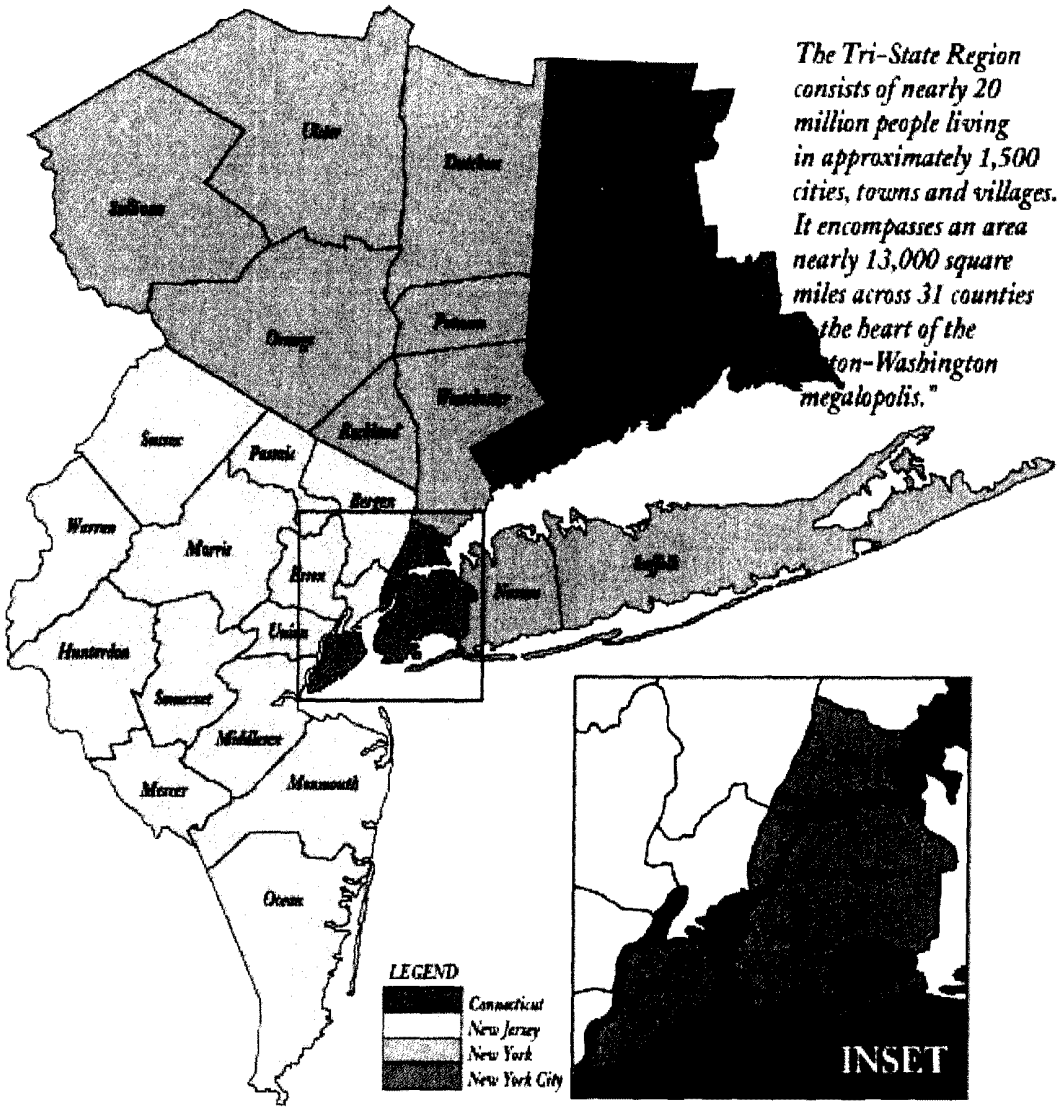
2010 census tract boundaries, 2013 American Community Survey five-year estimate labor force data, and 2014 annual average Local Area Unemployment Statistics (LAUS) data were used in this estimate. These data were ACS-shared as described by the U.S. Bureau of Labor Statistics in LAUS Technical Memorandum No. S-13-17.

Please feel free to contact me if you have any questions.

Sincerely,

Joseph Nardone

Figure 7-4. Map of New York Consolidated Statistical Area



8. Economic Impact of Construction Expenditures

The construction budget provided by the developer is summarized below in Table 8-1; this table is also shown in the Executive Summary. The EB-5 hard cost figure used for the calculations excludes the contingency. Soft costs are shown in detail in Table 8-2; only architecture and engineering costs are EB-5 eligible. FF&E costs include procurement consultant and installation.

Table 8-1. Summary of Construction and Development Budget

35-06 Leavitt Street, Suite CF-A, Flushing NY 11354
Tel: 718.939.1060 Fax: 718.939.1036
Email: centurygroup88@yahoo.com

Project Location : 64-06 Queens Blvd, Woodside, NY
Project Description : 135 rooms of Holiday Inn Express & Suites (b)(4)

CONSTRUCTION COST:

SCOPE OF WORK:

1. GENERAL

1.01 Mobilization & preparation
1.02 Insurance-general liability 25M & workmen comp
1.03 Sign-offs
1.04 Permit applications
1.05 Provide all necessary SOE inspections
1.06 Provide all necessary TR-2 TR-3
1.07 Provide engineer on site for supervision of all foundation and shoring work
1.08 Provide all necessary surveys
1.09 Provide all necessary shop drawings

2. SITEWORK

2.01 Provide and Install roof protection on adjacent buildings
2.02 Scaffold
  a. Provide and install Sidewalk Bridge
  b. Provide and install scaffold to roof
  c. Provide and install protection net to roof
  d. Scaffold reinforcement
2.03 Shoring, Sheeting & Lagging as per SOE
2.04 Temporary Protection Plywood Fence
2.05 Provide and install exterior material hoist
2.06 Excavation and backfill as necessary
2.07 Provide and install sidewalk, trees, curb and curb as per approved BPP

3. MASONRY

3.01 Concrete block as per drawings
3.02 Stucco in rear of building
3.03 Stone on first floor as per rendering

4. CONCRETE

4.01 Foundation wall, straps beams and pile caps
4.02 Concrete Slabs
4.03 Roof Bulkhead
4.04 Sidewalk, curbs and pavement
4.05 Surveys and stakeout
4.06 All waterproofing of exterior foundation walls

5. METALS

5.01 Concrete filled metal pan stairs
5.02 Metal framing and gates
5.03 Roof, railing and ladder
5.04 Structural metal framing
5.05 Provide and install steel dunnage
5.06 Omagalite exterior aluminum panel front and 2 sides

Queens Blvd Ventures LLC
35-06 Leavitt Street, Suite CF-A, Flushing NY 11354
Tel: 718.939.1060 Fax: 718.939.1036
Email: centurygroup88@yahoo.com (b)(4)

6. THERMAL & MOISTURE PROTECTION

- 6.01 Roof waterproofing
  - a. Six-ply rubber roofing
  - b. 2" rigid insulation
  - c. Vent sheet
  - d. Fire Stone 12 year labor and material warranty
- 6.02 Insulation
  - a. Exterior wall insulation close cell sprayed on
  - b. Interior wall insulation open cell sprayed on

7. DOORS & WINDOWS

- 7.01 Doors 1 3/4 " solid core doors, frames and hardware
- 7.02 Aluminum windows & storefront entrance by crystal or equal
- 7.03 All window system by crystal or equal per window schedule
- 7.04 All hollow metal door per schedule
- 7.05 Thermacore 490 garage door
- 7.06 Provide and install glass railing as per rendering

8. FINISHES

- 8.01 Gypsum board ceiling w / paint finished
- 8.02 Gypsum board wall w / paint finished
- 8.03 Epoxy paint for areaway, Elec.meter Rm., water meter Rm.
- 8.04 All apartment interior as per finish schedule
- 8.05 All hallways as per plan and finish schedule
- 8.06 All commercial, lobby as per design

9. CONVEYING SYSTEM

- 9.01 Provide and install Thyssen Krupp MRL 250FPM 2300# elevator
- 9.02 Standard cab $20,000 allowance

10. EQUIPMENT

- 10.01 Kitchen cabinets allowance is $5,000 per unit
- 10.02 All appliances
- 10.03 Bathroom accessories
- 10.04 Trash chute and compactor
- 10.05 Kitchen counter top to be Caesar Stone

11. MECHANICAL

- 11.01 HVAC system as per drawings
- 11.02 Provide and install exhaust & fresh air system as per drawings
- 11.03 Provide and install LG PTAC unit
- 11.04 Provide and install all kitchen and bath exhaust duct and fans
- 11.05 Provide and install HVAC system for lobby, trash storage and rec room PTAC

12. FIRE SYSTEM

- 12.01 Sprinkler system as per drawings
- 12.02 Stand Pipe system as per drawings
- 12.03 Provide and install sprinkler alarm system as per DOB and FDNY code

Queens Blvd Ventures LLC
35-06 Leavitt Street, Suite CF-A, Flushing NY 11354
Tel: 718.939.1060 Fax: 718.939.1036
Email: centurygroup88@yahoo.com

(b)(4)

13. ELECTRICAL

13.01 Apply and install all electrical meters
13.02 Provide and install electrical panels
13.03 Provide and install lighting fixtures as per plan
13.04 Provide and install emergency exit lights
13.05 Provide and install receptacles
13.06 Provide and install Aiphone color audio / video intercom system
13.07 Provide and install all Verizon, TimeWarner lines
13.08 Provide and install 100 Amp panels in every Apt. unit
13.09 Provide and install 1600 ConEd SEB
13.10 Provide temporary electrical service

14. PLUMBING WORK

14.01 Provide all utility services and meters
14.02 Install copper water supply & no-hub drainage system and all vent pipes
14.03 Supply & install plumbing fixtures as per owner's schedule
14.04 Install new gas main service with meters
14.05 All supply and return water lines
14.06 All kitchen gas pipes to all equipment in builing
14.07 Provide and install 1 duplex water booster and sewer ejector booster pump
14.08 Provide and install RZP as per design
14.09 Provide and install 3 150 Gal HWH and 1 25 Gal electrical HWH per residential
14.10 Provide and install all incoming water, sewer main as per plans

Total Hard Construction Cost :

FURNITURE, FIXTURES & EQUIPMENT (FF&E)

SOFT COST:
Architect & Engineer
Environmental
Interest Reserve

Total Soft Construction Cost :

Total Construction Cost :

LAND COST :

Total Project Cost :

All these figures are given in 2015 dollars, and should be deflated to 2010 dollars, since the input/output data are in 2010 dollars. Using the appropriate PPI indexes, the estimated cost of nonresidential construction would be expected to rise 13.3% over the five-year period, the cost of architectural and engineering fees would rise 7.7%, and the cost of FF&E would rise 4.0%; In all cases, the actual percentage increase in the PPIs from 2010 through 2014 were calculated, and it was then assumed the same rate of inflation would continue in 2015. The PPIs used ware (a) nonresidential construction, (b) architectural and engineering services, and (c) an

average of institutional furniture and audio/visual equipment. Thus in 2010 dollars, the EB-5 eligible figures would be [redacted] for hard costs, [redacted] for EB-5 eligible soft costs, and [redacted] for purchases of FF&E.

USCIS has requested information showing these construction costs are consistent with industry standards. Total hard construction cost is [redacted] and there are 135 rooms, which would be about [redacted] per room. However, construction costs in the Queens are 30% above the national average, according to RS Means, Square Foot Costs, 36th Annual Edition (2015), which would reduce this figure to about [redacted] very close to the average of midscale hotels with and without food and beverage, as shown in Table 8-2. The figure for purchases of FF&E is [redacted] for 135 rooms, or about [redacted] which is somewhat below the HVS figure.

Table 8-2. Cost of Construction per Room by Component and Class of Hotel

The next six tables show the economic impact of hard construction costs, EB-5 eligible soft costs, and purchases of FF&E. The tables show the impact for the 20 major industrial classifications in the RIMS II input/output model; because the project will take more than two years, direct as well as indirect and induced impacts are included for hard and soft costs, although not for FF&E. Please note that in these and succeeding tables, output and earnings are in thousands of dollars.

The ADR is given at [redacted] in 2018 dollars, with an occupancy rate of 75%. Since there are 135 rooms, that would be about [redacted] in room rates; when ancillary revenues are added, that figure rises to [redacted] That figure is in 2018 dollars, so it is deflated to 2010 dollars based on the assumption that the PPI for hotel room rates will rise an average of 3% per year for the 2010-2018 period. The deflated number is entered into the RIMS II model, and the detailed industry results are shown in the next two tables. After that, it is shown that (a) the ADR and occupancy rates are consistent with other similar Queens hotels, and (b) the number of direct employees per room is consistent with industry standards for this class of hotel.

(b)(4)

The ADR and occupancy rate can be compared to the competitive set of similar Queens hotels, which has been prepared by HVS in a comprehensive appraisal report. The competitive set of hotels used for this study is shown in Table 9-4. On that basis, the ADR in 2014 was $162.46, and the occupancy rate (RevPAR/ADR) was 84.2%. Assuming a 3% annual rate of inflation for hotel room prices from 2014 to 2018 would boost the ADR figure to $182.85, compared to $168.81 used for the first year pro forma in Table 9-1. Also, the first year occupancy rate used of 75% is well below the 84.2% average. Hence both these figures are conservative.

Table 9-4. Competitive Set of Hotels Used to Determine ADR and RevPAR

Property	Estimated 2014 Average Room Rate	Average Room Rate Penetration	Rooms Revenue Per Available Room (RevPAR)	RevPAR Penetration

(b)(4)

(b)(4)

(b)(4) As noted above, there are an estimated [redacted] direct employees for 135 rooms, or about [redacted] per room. It has already been shown in the previous section that this hotel qualifies as a mid-scale hotel based on the cost of construction. We next consider the nunber of employees per hotel room for various classes based on the following surveys. Where appropriate these are explained below and citations are provided. Luxury hotels are not included in this list.

1. Smith Travel Research (STR), full-service hotels.
2. HVS International Survey, full-service and lower
3. ECA survey, based on actual data for over 50 EB-5 hotel projects for which economic impact analyses have been prepared, all classes

The STR figure for direct employees per room for full-service hotels is calculated as follows. According to the data given in Table 9-6, total revenues per occupied room are $240 per night, and payroll and related expenses (including fringe benefits) are 33.5% of this amount, or $77.53 per day, which is $28,300 per year. BEA data for 2011 shows the average annual wages and salaries for full-time equivalent hotel workers is $34,314, and including fringe benefits is $39,775. Hence the ratio of actual expenses to FTE compensation is 28300/39775, or 0.71 employees per room for full-service hotels. For limited-service hotels, similar calculations yield 0.28 direct employees per room.

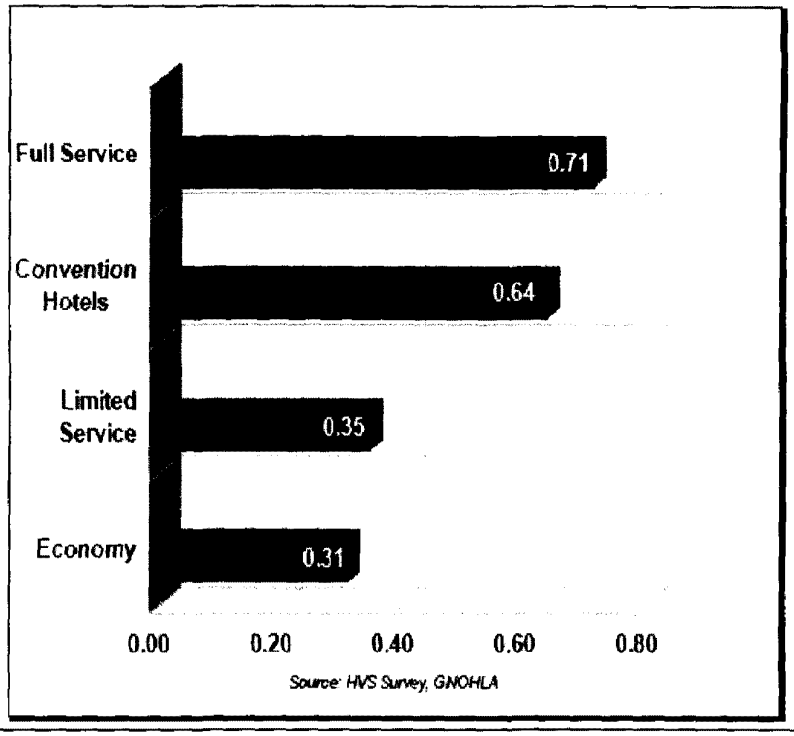
The HVS survey shows 0.35 direct employees per room for limited-service hotels, which is above the STR results.

Employees per Room by Hotel Service Category



Finally, we turn to the survey undertaken by Evans, Carroll & Associates (ECA) based on more than 50 actual case studies undertaken by the company for EB-5 economic impact analysis; a complete list of EB-5 projects done by the company is shown in the appendix. These surveys were undertaken from 2008 through 2013.

ECA has calculated the likely breakdown of the 62 employees per 100 hotel rooms for standard and upscale hotels. The maid service figure is based on each maid cleaning 12 rooms per day; in some hotels, the figure is as high as 15 rooms per day, but that is unusual. This figure declines as the size of the room increases, and is estimated to be 8.3 rooms per day for luxury establishments. The front desk figure for a standard hotel assumes 3 people for each of 2 shifts and 2 people for the third shift; this figure also includes receptionists and people who answer the phone.

For a luxury hotel, we found there are 6 people per shift at the front desk, and the addition of concierge and bellhop personnel throughout the day and night. The food service figures have been expanded to include room service and an extensive trade in meeting and banquet facilities. Three employees are available on each shift for customer relations instead of one. Similarly, three employees instead of two are available per shift for management, security, engineering, and inside maintenance, and janitorial services and outside maintenance, In addition, two employees per shift are added for reservations and for meeting and banquet facilities. All these results are summarized in Table 9-6.

Table 9-6. Hotel Employees Per 100 Rooms

Category	Budget	Standard	Upscale	Semi Luxury	True Luxury
Maid Service					
Front Desk					
Doormen					
Bellhops					
Parking Valets					
Concierge					
Food Service					
Customer relations					
Management					
Security					
Engineering/inside maint					
Janitor/outside maint					
Reservations					
Meeting & Banquet					
Total					

(b)(4)

Based on the construction costs, this hotel is close to what would be called a "standard" or "midscale" hotel; but based on the minuscule proportion of revenues derived from ancillary services, it would be closer to the limited-service category. For the limited-service category, the three surveys show 0.28, 0.35, and 0.32 direct employees per room, for an average of [redacted] direct employees per room. That is the same figure as is calculated from the RIMS II model.

(b)(4)

(b)(4)

10. Summary Tables for the Entire Project

The two tables in this section show the combined effects of hard and soft construction costs and hotel operations for the Holiday Inn Express hotel located at 64-06 Queens Ave., Woodside, NY. The sums (or averages) are the aggregates of the tabular results shown in Sections (8) and (9) and are shown here for ease of exposition.

Table 10-1. Increase in Employment, Output, and Earnings for Construction, Hotel Operation, and Rental Income

Industry group	Employment	Output	Earnings
Agriculture, forestry, fishing,			
Mining			
Utilities			
Construction			
Manufacturing			
Wholesale trade			
Retail trade			
Transportation and warehousing			
Information			
Finance and insurance			
Real estate and rental and leasing			
Professional and scientific services			
Management of companies			
Admin and waste mgmt services			
Educational services			
Health care and social assistance			
Arts, entertainment, and recreation			
Accommodation			
Food services and drinking places			
Other services			
Household			
Total			

Table 10-1 shows there will be a total of [redacted] jobs created from the construction and hotel operations. Output would rise about [redacted] while household earnings would increase by about $[redacted] Table 10-2 shows the average output per new worker is about [redacted] while average earnings are about [redacted]

(b)(4)

Table 10-2. Output and Earnings Per New Worker, Construction, Hotel Operation, and Rental Income			
Industry group	Employment	Output/Empl	Earnings/Empl

Appendix: Resume of Dr. Michael K. Evans

mevans@evanscarrollecon.com

CURRENT AND PREVIOUS POSITIONS

• Chairman, *Evans, Carroll & Associates, Inc.*, 1980-present (previously Evans Economics)

Economic consulting firm specializing in EB-5 immigration analysis, economic impact studies of development projects and new construction, models of state and local tax receipts, impact of current and proposed government legislation, and construction of econometric models for individual industries and companies.

• Chief Economist, *American Economics Group*, 2000-2008.

Built a comprehensive state modeling system that provides economic analysis for a variety of consulting projects (see below).

• Clinical Professor of Economics, Department of Managerial Economics and Decision Sciences (MEDS), Kellogg Graduate School of Management, Northwestern University, 1996-99.

Taught courses in macroeconomics and business forecasting. Wrote textbooks for both courses.

• Winner of Blue Chip Economic Indicator Award for most accurate macroeconomic forecasts during the past four years, November 1999

• Founder and President, *Chase Econometric Associates*, 1970-1980

• Assistant and Associate Professor of Economics, Wharton School, University of Pennsylvania, 1964-69. Co-developer of the original Wharton Model.

• Visiting Professor, Radford University, (Radford, VA), 1987

Chairman of Institute for International Economic Competitiveness

• Visiting Lecturer, Hebrew University (Jerusalem), 1966-67

Built econometric model of the Israeli economy

• Ph. D. in Economics, Brown University. Dissertation, "A Postwar Quarterly Model of the United States Economy, 1948-1962". A. B. in Mathematical Economics, Brown University

PREVIOUS ACTIVITIES AND EDUCATION

• Contributing Editor, *Industry Week*

Wrote a column in each issue on economic and financial trends as they impact the manufacturing sector.

• Editor, *The Evans Report*

Weekly newsletter discussing economic trends and financial markets. Pioneered the concept of the Monthly Tracking Model to incorporate recent economic releases into the overall economic forecast, including methods to predict these economic data.

• Consultant, *National Printing Equipment and Supply Association*

Prepared quarterly forecasts of shipments of printing equipment and graphic arts supplies by product line, based on an econometric model constructed for NPES. Also prepares analysis and forecasts of exports and imports by principal product line.

• Consultant, *APICS -- The Educational Society for Resource Management*,

Designed and developed the *APICS Business Outlook Index*, which used survey data collected by the Evans Group to measure current production, production plans, shipments, employment, new orders, unfilled orders, inventory stocks, and the comparison of the actual to desired inventory/sales ratio to predict short-term changes in manufacturing sector activity. The results of this survey appeared every month in *APICS: The Performance Advantage*

• Consultant, *American Hardware Manufacturing Association*

Wrote a separate weekly edition of the Evans Report analyzing recent trends in the hardware and housing industries, including forecasts of the hardware industry based on an econometric model developed for AHMA.

• Board of Economists, *Los Angeles Times*

Wrote column every 6 weeks (5 other economists on the Board)

• Columnist, *United Press International*

Wrote twice-weekly column, "Dollars and Trends"

• Consultant, Senate Finance Committee,

Built the first large-scale supply-side model of the U. S. economy

- Consultant, Environmental Protection Agency and Council on Environmental Quality

  Estimated inflationary impact of government regulations

- Consultant, National Aeronautics and Space Administration

  Estimate impact of R&D spending on productivity growth

- Consultant, U. S. Treasury

  Estimated impact of investment tax credit and accelerated depreciation on capital spending by industry

- Consultant, U. S. Department of Agriculture

  Built large-scale econometric model of agricultural sector of U. S. economy

- Consultant, Organization of Economic Cooperation and Development

  Built econometric model of the French economy

SAMPLE OF RECENT CONSULTING PROJECTS

A. Economic Impact of EB-5 Immigrant Investor Programs and New Markets Tax Credits

For more information on these projects, see www.evanseb5.com

Key to symbols: N, new regional center, E, extension of existing center

List is current as of July 20, 2014. There are over 500 projects listed, but while the list is extensive, it is not complete. In cases where the results are very similar, they are either grouped together or omitted entirely

E • Calculated the economic impact of construction and operation of medical college in Sacramento, CA.

E • Calculated the economic impact of construction and operation of mixed-use building in Madison County, AL.

E • Calculated the economic impact of construction and operation of hotels in the Dallas/Fort Worth, Houston, San Antonio, and Austin metropolitan areas as part of the 43-county "Texas Triangle" (2 projects)

E • Calculated the economic impact of construction and operation of boutique hotel in Flushing, Queens, NY

E • Calculated the economic impact of construction and operation of several fast-food seafood restaurants in Miami/Dade County, FL

N • Calculated the economic impact of construction and operation of technology incubator in the Boston, MA area.

E • Calculated the economic impact of construction and operation of various hotels in Brooklyn and Queens, NY (3 projects)

E • Calculated the economic impact of construction and operation of a hotel and restaurants in Rancho Cucamonga, FL (2 projects)

E • Calculated the economic impact of construction and operation of assisted living center in Las Vegas, NV

N • Calculated the economic impact of expansion of a manufacturing plant to produce electric vehicles and parts, Jackson County, OR

E • Calculated the economic impact of construction and operation of residential housing development in South Florida (2 projects)

E • Calculated the economic impact of construction and operation of the Orlando Skypark in Orlando, FL

E • Calculated the economic impact of construction and operation of drilling and operating oil and gas wells in Texas (3 projects)

E • Calculated the economic impact of construction and operation of senior living facility in Flushing, Queens, NY

E • Calculated the economic impact of renovating and expanding the Queen Mary ship and adding various entertainment facilities

E • Calculated the economic impact of construction and operation of a water park in Temecula, CA

E • Calculated the economic impact of construction and operation of a hotel and conference center in Rockford, IL

E • Calculated the economic impact of construction and rental income from an apartment building in Portland, OR, and Glendale, CA (2 projects)

E • Calculated the economic impact of expansion of the Atlantic Yards project in Brooklyn, NY

E • Calculated the economic impact of construction and operation of a luxury office building and a luxury condominium building in mid-town Manhattan (2 projects)

E • Calculated the economic impact of construction and operation of a biofuels plant, converting sugar to fuels in South Florida

E • Calculated the economic impact of renovation and expansion of a Blue Cross Call center in Columbus, GA

E • Calculated the economic impact of construction and operation of the Brooklyn Bridge marina and yacht club

E • Calculated the economic impact of construction and rental income of an apartment building in Houston, TX

E • Calculated the economic impact of construction and operation of a hotel building in Nashville, TN

E • Calculated the economic impact of construction and operation of a hotel in the NoMad district of Manhattan

E • Calculated the economic impact of construction and rental income of a townhouse development in Dublin, CA

E • Calculated the economic impact of construction and rental income of an housing development in Dallas, TX

E • Calculated the economic impact of construction and operation of a Times Square hotel in Manhattan

E • Calculated the economic impact of construction and operation of hotels in various counties in the Permian Basin in West Texas

E • Calculated the economic impact of construction and operation of a hotel building in Houston, TX

E • Calculated the economic impact of construction and rental income of high-rise hotels in downtown Chicago (3 projects)

N • Calculated the economic impact of construction and operation of an amusement park in suburban Phoenix, AZ

E • Calculated the economic impact of construction and operation of a mixed-use building in Stamford, CT

E • Calculated the economic impact of construction and operation of a hotel, resort, and casino in the Commonwealth of the Mariana Islands (CNMI).

E • Calculated the economic impact of construction and operation of a mixed-use building in Stamford, CT

E • Calculated the economic impact of construction and operation of a combined hotel and day care center, Queens, NY

E • Calculated the economic impact of construction and operation of a charter school in Broward County, FL

E • Calculated the economic impact of construction and operation of a mixed-use building in Stamford, CT

E • Calculated the economic impact of construction and rental income of an apartment building in Hollywood, CA.

E • Calculated the economic impact of development of a sports stadium in Los Angeles

E • Calculated the economic impact of construction and operation of a hotel in Tacoma, WA

E • Calculated the economic impact of construction and operation of a hotel in Nyack, NY

E • Calculated the economic impact of construction and operation of a mixed-use building in Atlanta, GA

E • Calculated the economic impact of construction and operation of a charter school in Palm Beach County, FL

E • Calculated the economic impact of construction and operation of mixed-use buildings in Chicago (2 projects)

N • Calculated the economic impact of construction and operation of a sawmill in Arkansas

E • Calculated the economic impact of construction and operation of a hotel in Miami, FL

E • Calculated the economic impact of construction and operation of a hotel on the West Side of Manhattan

E • Calculated the economic impact of construction and operation of a mixed-use building in Temecula, CA

E • Calculated the economic impact of construction and operation of a charter school in Sarasota, FL

E • Calculated the economic impact of construction and operation of a gold mine in Washoe County, NV

E • Calculated the economic impact of construction of luxury housing development in Northern Virginia

E • Calculated the economic impact of renovating part of the Oakland, CA waterfront

E • Calculated the economic impact of construction and operation of a hotel in Puerto Rico

E • Calculated the economic impact of construction and operation of a warehouse in Chicago

E • Calculated the economic impact of renovation and expansion of the Nassau Coliseum, Nassau County, NY

N • Calculated the economic impact of construction and operation of country and western Music center in Riverside County, CA

E • Calculated the economic impact of construction and operation of mixed-use commercial building, Staten Island, NY

E • Calculated the economic impact of construction and operation of hotel in Queens, NY

N • Calculated the economic impact of construction and operation of hotel and resort on the U. S. Virgin Islands

E • Calculated the economic impact of construction and operation of geothermal energy project in Nevada

E • Calculated the economic impact of construction and operation of hotel in Kenosha, WI

E • Calculated the economic impact of construction and operation of hotel in Hudson County, NJ (2 projects)

E • Calculated the economic impact of construction and operation of hospital in Chicago

E • Calculated the economic impact of renovation of old luxury hotel in Yonkers, NY

E • Calculated the economic impact of construction and rental income of apartment in Seattle, WA

E • Calculated the economic impact of construction and operation of restaurant in Las Vegas

E • Calculated the economic impact of construction and operation of bottle cap manufacturing plant

E • Calculated the economic impact of construction and operation of hotel in Michigan

E • Calculated the economic impact of construction and operation of charter school in South Florida (2 projects)

E • Calculated the economic impact of construction and rental income of apartment building in Jersey City

E • Calculated the economic impact of construction and operation of hotel in Brooklyn

E • Calculated the economic impact of construction and operation of hotel in Oakland, CA

E • Calculated the economic impact of construction and operation of hotel in Queens, NY

E • Calculated the economic impact of construction and operation of hotel and resort in the Mariana Islands

E • Calculated the economic impact of renovation and operation of hotel in Adams Morgan section of Washington, DC

E • Calculated the economic impact of construction and operation of hotel in Farmers Market section of Dallas

E • Calculated the economic impact of renovation of old Taystee Baking facility in Harlem, Manhattan, NY

E • Calculated the economic impact of development of master plan project for Treasure Island, San Francisco

E • Calculated the economic impact of construction and operation of hotel and resort in Puerto Rico

E • Calculated the economic impact of construction and operation of hotel in Yonkers, NY

E • Calculated the economic impact of construction and operation of "Discovery New York" entertainment center

E • Calculated the economic impact of construction and operation of hotel in Los Angeles (2 projects)

N • Calculated the economic impact of construction and operation of plant for steel fabrication in Alabama.

E • Calculated the economic impact of construction and operation of hotel and condominium in San Bernardino county, CA

N • Calculated the economic impact of construction and operation of a chain of frozen yogurt restaurants in the Gulf Coast area stretching from Florida to Texas

E • Calculated the economic impact of construction and operation of drilling for oil and gas wells in Texas

E • Calculated the economic impact of construction and operation of proton cancer center in Los Angeles County

E • Calculated the economic impact of construction and operation of hotels in Los Angeles (3 projects)

E • Calculated the economic impact of construction and operation former Deauville hotel in Miami Beach, FL

E • Calculated the economic impact of construction and operation of boutique hotel in Ontario, CA.

E • Calculated the economic impact of construction and operation of hotel in mid-town Manhattan.

E • Calculated the economic impact of renovation and operation of a commercial mixed-use building in San Francisco.

E • Calculated the economic impact of construction and operation of luxury condominium building in downtown Manhattan.

E • Calculated the economic impact of construction and rental income of a medical facility in Winston-Salem, NC

E • Calculated the economic impact of construction and rental income of office building in mid-town Manhattan.

E • Calculated the economic impact of construction and rental income of office building in downtown Cleveland, OH.

E • Calculated the economic impact of construction and operation of mixed-use commercial and residential project in Tacoma, WA.

E • Calculated the economic impact of construction and operation of senior living facility in Chicago.

N • Calculated the economic impact of construction and operation of manufacturing plant to produce synthetic coke fuel for steel manufacturing in rural West Virginia.

E • Calculated the economic impact of construction and operation of apartment building in Washington, DC.

E • Calculated the economic impact of construction and operation of medical complex in Flushing, Queens, NY.

E • Calculated the economic impact of construction and operation of hotel in Chicago

E • Calculated the economic impact of construction and operation of insurance plan for pets, headquartered in New York City.

E • Calculated the economic impact of construction and operation of hotel in the Gowanus district of Brooklyn.

E • Calculated the economic impact of construction and operation of hotel near Times Square, Manhattan

E • Calculated the economic impact of construction and operation of 3 senior living and residential facilities in Southeast FL.

E • Calculated the economic impact of construction and operation of senior living and residential facilities in Seattle WA.(3 different projects)

E • Calculated the economic impact of construction and operation of charter school in Palm Beach County, FL

E • Calculated the economic impact of construction of mixed-use commercial project and infrastructure in New York City.

N • Calculated the economic impact of construction and operation of pellet mill in Arkansas, used to make fuel pellets mainly for export to Europe.

E • Calculated the economic impact of construction of senior living facilities in Houston, Texas

E • Calculated the economic impact of construction of skilled nursing facility in Las Vegas, NV

E • Calculated the economic impact of construction and operation of hotel in Chicago

E • Calculated the economic impact of construction and operation of wholesale distribution center and retail outlets in Queens, NYC

E • Calculated the economic impact of construction and operation of New Quincy Market in Quincy, MA.

E • Calculated the economic impact of operation of fund for providing capital for production of films in New Orleans, LA

E • Calculated the economic impact of renovation and operation of mixed-use facilities and rebuilding of infrastructure in Harlem, Manhattan, NYC

E • Calculated the economic impact of construction and operation of mixed-use residential and commercial buildings in New York City (2 projects)

N • Calculated the economic impact of construction and operation of sports complex in Attleboro, MA.

E • Calculated the economic impact of construction and operation of sports stadium and related retail ventures in Las Vegas, NV

E • Calculated the economic impact of construction and operation of resort complex in Hawaii

E • Calculated the economic impact of construction and operation of mixed-use commercial and residential property in Emerald Falls, OK

E • Calculated the economic impact of construction and operation of five hotels in rural Texas

N • Calculated the economic impact of developing and operating oil wells in the Bakken Formation in North Dakota.

E • Calculated the economic impact of construction and operation of 4 mixed-use buildings in the New York City metropolitan area.

E • Calculated the economic impact of construction and operation of a hotel in Queens, NYC

E • Calculated the economic impact of constructing and operating a hotel near LaGuardia airport, New York

E • Calculated the economic impact of constructing and operating a restaurant and wine bar on the Las Vegas strip.

E • Calculated the economic impact of constructing a medical complex in the Bronx, NY

E • Calculated the economic impact of constructing and operating a theme park restaurant in Downtown Disney World, Orlando, FL

E • Calculated the economic impact of constructing and operating an oil refinery in the Houston, TX metropolitan area

N • Calculated the economic impact of developing a planned town with single and multi-family residences, commercial space, and solar energy on a ranch in Hendry County, FL

E • Calculated the economic impact of developing a luxury condominium in Miami, FL

E • Calculated the economic impact of constructing and operating a hotel near Times Square, New York City

E • Calculated the economic impact of constructing and operating a hotel in Pascagoula, MS

E • Calculated the economic impact of constructing and operating a hotel in Orlando, FL

E • Calculated the economic impact of constructing and operating a senior living facility in suburban Atlanta, GA

E • Calculated the economic impact of expansion of commercial facilities in Cleveland, OH in (a) the area around University Circle, and (b) the downtown Flats area.

N • Calculated the economic impact of constructing and operating a geothermal power plant in Oregon.

E • Calculated the economic impact of constructing and operating a luxury apartment building in downtown Manhattan

E • Calculated the economic impact of constructing and operating a senior living facility in Palm Beach County, FL

E • Calculated the economic impact of constructing several multi-family residential buildings in Texas (3 separate projects)

E • Calculated the economic impact of operating a home insurance company to relieve the burden of Citizens Insurance in the State of Florida.

E • Calculated the economic impact of constructing and operating a restaurant chain specializing in high-quality health foods, Palm Beach County, FL

E • Calculated the economic impact of constructing and operating multi-family residential properties, hotels, and senior living facilities in the Denver metropolitan area.

E • Calculated the economic impact of constructing and operating multi-family residential properties, hotels, and senior living facilities in the Atlanta metropolitan area.

E • Calculated the economic impact of constructing and operating multi-family residential properties, hotels, and senior living facilities in the Atlanta metropolitan area.

E • Calculated the economic impact of constructing and operating multi-family residential properties, hotels, and senior living facilities in the Miami metropolitan area.

E • Calculated the economic impact of producing a series of 10 major motion pictures ($100 million or more each) in the New York City area.

E • Calculated the economic impact of constructing luxury homes on Key Largo, FL

N • Calculated the economic impact of construction and operation of three projects in Puerto Rico: a hotel in San Juan, a condo/hotel village in Arecibo, and a power plant in Loiza. Used Puerto Rico input/output model updated by ECA.

N • Calculated the economic impact of construction and operation of a time-sharing condominium in Hawaii.

E • Calculated the economic impact of constructing and operating a large Ferris Wheel on the Las Vegas strip, including the impact of advertising revenues and ancillary retail space.

E • Calculated the impact of operating an insurance company in South Florida.

N • Calculated the economic impact of constructing and operating a medical complex in the Houston, TX metropolitan area.

N • Calculated the economic impact of constructing a new interchange for the Pennsylvania Turnpike and I-95.

E • Calculated the economic impact of constructing and operating a mixed-use commercial facility in Newark, NJ

E • Calculated the economic impact of improving the infrastructure at the waterfront in Oakland, CA

E • Calculated the economic impact of constructing and operating a hotel in San Diego CA.

E • Calculated the economic impact of constructing and operating a hotel in downtown Cleveland, OH

E • Calculated the economic impact of constructing three multi-family residential properties in Austin, TX.

E • Calculated the economic impact of renovating and operating the former Wilshire hotel in Los Angeles.

E • Calculated the economic impact of constructing and operating a luxury hotel in Austin, TX

E • Calculated the economic impact of constructing a mixed-use industrial facility in Pflugerville, TX

E • Calculated the economic impact of constructing and operating charter schools in several different locations in Florida, and in Chicago (5 separate projects).

N • Calculated the economic impact of constructing and operating a manufacturing plant for wood pellets used for heating in Southern Georgia

E • Calculated the economic impact of constructing and operating a wind farm in the Texas panhandle.

E • Calculated the economic impact of constructing several luxury apartment buildings and hotels in Manhattan (4 separate projects)

E • Calculated the economic impact of operating a steel distribution center in Palm Beach County, FL

N • Calculated the economic impact of operating a boat for cleaning and processing fish anchored off the Mississippi River in Kentucky.

E • Calculated the economic impact of constructing and operating hotels in Seattle, WA (2 separate projects)

N • Calculated the economic impact of operation of a facility for bio-science trials, Newark, NJ

N • Calculated the economic impact of building and operating a steel mill in Northeast Arkansas.

E • Calculated the economic impact of drilling and extracting oil, natural gas, and natural gas liquids, Oklahoma (2 projects)

E • Calculated the economic impact of expanding a golf and ski resort, and a furniture manufacturing plant, in Northern New Hampshire

E • Calculated the economic impact of constructing and operating a medical facility and student dormitory in Brooklyn, NY

N • Calculated the economic impact of oil drilling and extraction in Marion County, TX

E • Calculated the economic impact of developing and operating mixed-use facilities in Los Angeles

N • Updated an input/output model for Puerto Rico, and used this model to determine the economic impact of constructing and operating a resort in Boqueron Bay

E • Calculated the economic impact of renovating properties for Mississippi State University and adding a hotel

E • Calculated the economic impact of renovating an assisted living facility in Anniston, AL

E • Calculated the economic impact of constructing an apartment tower in Phoenix, AZ

E • Calculated the economic impact of constructing and operating a hotel in Dallas, TX. Also calculated the impact of two assisted living centers in Dallas.

N • Calculated the economic impact of a mixed-use commercial facility in New London, CT.

N • Calculated the economic impact of a mixed-use commercial facility in suburban Chicago, IL

• Calculated the economic impact of a hotel, casino, and commercial mixed-use properties on the island of Matsu, Taiwan Republic (not an EB-5 project but similar methodology was used)

N • Calculated the economic impact of extracting lithium compounds from the Salton Sea in Imperial County, CA

N • Calculated the economic impact of constructing and operating geothermal power plants in southern CA

E • Calculated the economic impact of constructing luxury hotels and condominiums in Manhattan (6 separate projects)

N • Calculated the economic impact of producing motion pictures and TV programs in Miami, FL

E • Calculated the economic impact of constructing and operating a hotel, shopping center, and residences in Boca Raton, FL

E • Calculated the economic impact of developing and operating a time-sharing resort on Lake Tahoe, CA

N • Calculated the economic impact of a series of child day care and learning centers in San Antonio and Austin, TX

N • Calculated the economic impact of a mixed-use commercial and cultural center in Chinatown, Philadelphia

E • Calculated the economic impact of developing and operating charter schools in Florida (4 projects)

N • Calculated the economic impact of developing the Boston Seaport project near the Boston Harbor.

E • Calculated the economic impact of a mixed-use hotel and commercial project in downtown Boston, MA

E • Calculated the economic impact of expanding the Hialeah racetrack, Hialeah, FL

E • Calculated the economic impact of developing and expanding a resort area in Benton Harbor, MI

N • Calculated the economic impact of developing and operating a Holiday Inn near the World Trade Center, Manhattan

N • Calculated the economic impact of developing and operating a Marriott Courtyard hotel in downtown Houston.

N • Calculated the economic impact of building a greenhouse in Central California.

N. Calculated the economic impact of developing an aircraft manufacturing plant in Northeast Arkansas.

N. Calculated the economic impact of developing and operating alternative fuels plant in Clark County, NV.

N • Calculated the economic impact of a destination winery and associated attractions in North Carolina.

E • Calculated the economic impact of building and operating a luxury hotel in Palm Beach, FL

N • Calculated the economic impact of operating a Kosher cheese plant in upstate New York

E • Calculated the economic impact of developing and operating a hotel in Chicago, IL

N • Calculated the economic impact of expanding the operations of a plumbing and HVAC contractor

E • Calculated the economic impact for 4 separate projects in Guam, based on the input/output model previously developed by ECA

E • Calculated the economic impact of a resort in the Commonwealth of the Northern Mariana Islands, based on the input/output model previously developed by ECA.

E • Calculated the economic impact of several mixed-use commercial projects in Southern California (4 such projects, each one covering 4 to 6 counties, including Clark County, NV)

E • Calculated the economic impact of a hotel in Norwalk, CT

E • Calculated the economic impact of copper mines throughout the state of Arizona

E • Calculated the economic impact of water park and hotel in Arlington Heights, IL (suburban Chicago)

N • Calculated the economic impact of renovation and expansion of Las Vegas casino (3 separate projects)

N • Calculated the economic impact of construction and operation of mixed-use shopping and commercial center in Hollywood Park, FL

N • Calculated the economic impact of development of office building in South Union Lake region of Seattle, WA

E • Calculated the economic impact of Development of mixed-use commercial and residential building in downtown Seattle, WA

N. • Calculated the economic impact of commercial mixed-use projects in New York City, upstate New York, and Northern New Jersey (one project)

N • Calculated the economic impact of developing and operating a major amusement park complex (rival to Disney World) near Lake Okeechobee, FL

N•. Calculated the economic impact of constructing and operating a hotel and conference center in Toledo, Ohio.

N. • Calculated the economic impact of renovating and expanding the New York Military Academy in Newburgh, NY

N • Calculated the economic impact of developing a mixed-use commercial project in downtown Philadelphia, PA (2 separate projects)

N • Calculated the economic impact of a film studio to produce motion pictures and TV programs in Los Angeles, CA.

N • Calculated the economic impact of building student housing in Arlington, TX

N • Calculated the economic impact of developing and operating a manufacturing plant for sports medical devices in suburban Chicago, IL

N • Calculated the economic impact of developing natural gas wells and wind farm in the Pocono Mountains section of Pennsylvania.

N • Calculated the economic impact of an assisted living center, hotel, and water park in Eastern CT.

N • Calculated the economic impact of producing movies in New Mexico

N • Calculated the economic impact of developing and operating a chain of child learning centers in Houston, TX

N • Calculated the economic impact of developing and operating a chain of medical research and supply centers in Houston.

N • Calculated the economic impact of developing and operating a chain of frozen yogurt stores in a wide area along the Gulf of Mexico, including locations in Florida, Alabama, Mississippi, Louisiana, and Texas

N • Calculated the economic impact of developing and operating assisted living centers and ancillary activities for several locations in Northeast Florida.

N • Calculated the economic impact of the construction and operation of an assisted living center in Santa Ana, CA

N • Calculated the economic impact of the construction and operation of several BBQ restaurants in South Florida.

N • Calculated the economic impact of the drilling oil wells in 8 counties in Texas and Louisiana.

N • Calculated the economic impact of operating coal mines for metallurgical coal in West Virginia.

N • Calculated the economic impact of operating gold mines in Alaska.

N • Calculated the economic impact of constructing and operating a mixed-use commercial center in Flushing, NY

N • Calculated the economic impact of constructing and operating two hotels, one in downtown San Diego, and one in Escondido, CA

N • Calculated the economic impact of expanding and operating an auto racing track in Palm Beach, FL

N• Calculated the economic impact of building and operating mobile housing villages for disaster relief.

N• Calculated the economic impact of operating an "incubator" for research on medical devices, preparations, and services in Houston, TX.

N• Calculated the economic impact of constructing and operating a mixed-use commercial center in Denver, CO.

N• Calculated the economic impact of constructing and operating a charter school in Miami/Dade County, FL

E• Calculated the economic impact of constructing and operating a hotel in Manhattan, NY

N● Calculated the economic impact of constructing and operating hotels, assisted living centers, and mixed-use commercial buildings in 8 counties in Southern California

N● Calculated the economic impact of constructing and operating a charter school in Broward County, FL

N● Calculated the economic impact of renovating a former public housing project in Chicago, IL

N● Calculated the economic impact of starting a high-tech company for optical displays in Orlando and Gainesville, FL

N● Calculated the economic impact of constructing and operating luxury hotels in four Southern California counties

E● Calculated the economic impact of expanding a manufacturing company in Ann Arbor, MI

N● Calculated the economic impact of reconverting an old mill building into offices and other commercial uses in Bristol County, MA

N● Calculated the economic impact of a film and TV production studio in Los Angeles, CA

N● Calculated the economic impact of constructing and operating various residential and commercial buildings in 35 Texas counties.

N● Calculated the economic impact of constructing and operating the world's tallest residential structure in Chicago, IL

N● Calculated the economic impact of constructing and operating a mixed-use commercial and residential building in Seattle, WA

N● Calculated the economic impact of constructing and operating a hotel in Cleveland, OH

N● Calculated the economic impact of a research facility in Jupiter, FL

N● Calculated the economic impact of constructing and operating an assisted living center in Horry County, SC

N● Calculated the economic impact of constructing and operating a chain pharmacy in Chicago, IL

E● Calculated the economic impact of constructing and operating a high-end hotel and resort in Aspen, CO

N● Calculated the economic impact of constructing and operating an assisted living center in Dallas, TX

E● Calculated the economic impact of constructing and operating an medical assistance company in Bronx, NY

E● Calculated the economic impact of constructing and operating a mixed-use commercial building in Queens, NY

E● Calculated the economic impact of operating a livery service in Queens, NY

N● Calculated the economic impact of constructing and operating residential properties in Southern California

N● Calculated the economic impact of operating a film and TV production studio in Los Angeles, CA

N● Calculated the economic impact of drilling oil wells in Montana

N● Calculated the economic impact of constructing and operating various residential and commercial buildings for 43 counties in Texas

E● Calculated the economic impact of constructing and operating a restaurant and dinner theater in Guam

N● Constructed an input/output model for the Commonwealth of the Northern Mariana Islands, and used it to calculated the economic impact of constructing and operating a restaurant in Saipan.

E● Calculated the economic impact of constructing and operating a new hotel in Miami, FL

E● Calculated the economic impact of constructing and operating a resort and wellness center in South Florida

N● Calculated the economic impact of expanding and operating a ski resort in Vermont.

N● Calculated the economic impact of constructing and operating residential and commercial buildings in 20 counties in South Central Texas

N● Calculated the economic impact of constructing and operating a hotel near the Newark, NJ airport

E● Calculated the economic impact of constructing and operating a company to process health insurance benefits in South Florida

E● Calculated the economic impact of constructing and operating a veterinary hospital in Palm Beach County, FL

N● Calculated the economic impact of constructing and operating various residential and commercial buildings for all counties in MA, CT, RI, and NH

N● Calculated the economic impact of constructing and operating a residential construction company in Maryland

N● Calculated the economic impact of constructing and operating various residential and commercial buildings for the entire state of Oklahoma

N● Calculated the economic impact of constructing and operating a company for manufacturing dental implants in Cuyahoga County, OH

N● Calculated the economic impact of constructing and operating a mixed-use commercial facility in Brooklyn, NY

N● Calculated the economic impact of constructing and operating an office building for financial services in downtown Manhattan, NY

N● Calculated the economic impact of constructing and operating a mixed-use facility in Southern California

N● Calculated the economic impact of constructing and operating a retail shopping center in Tampa, FL

N● Calculated the economic impact of constructing and operating a retail shopping center in Tampa, FL

N● Calculated the economic impact of constructing and operating a mixed-use commercial building in Seattle, WA

N● Calculated the economic impact of constructing and operating a charter school in Arizona

N● Calculated the economic impact of constructing and operating a resort in northeastern Utah

N● Calculated the economic impact of operating an online video game company

N● Calculated the economic impact of constructing and operating a hotel in New York City

N● Calculated the economic impact of constructing and operating a fashion mall in South Florida

E● Calculated the economic impact of construction and operation of a new automobile assembly plant in Petersburg, VA

N● Calculated the economic impact of operating a call center for the U.S. government in Muskogee, OK

N● Calculated the economic impact of developing a mixed-use commercial and residential center in Scottsdale, AZ

N● Calculated the economic impact of constructing and operating a "Green Box" facility in New Jersey to process waste material on a pollution-free basis.

N● Calculated the economic impact of constructing and operating a "Green Box" facility in Washington State to process waste material on a pollution-free basis.

E● Calculated the economic impact of constructing and operating a new hotel in Coral Gables, FL

E● Calculated the economic impact of developing a new residential community in Brevard County, and retail stores and restaurants in St. Lucie County, FL

N • Calculated the economic impact of a new business to store and process field crops in Madison, MS

N• Calculated the economic impact of operating food service establishments and assisted living centers in 40 counties in Texas.

E• Calculated the economic impact of developing a mixed-use commercial center in Miami, FL

N• Calculated the economic impact of renovating a theater in New York City to show film highlights of previous Broadway hits.

N• Calculated the economic impact of renovating and operating distressed buildings in the San Francisco Bay area.

E• Calculated the economic impact of a mixed-use commercial center in Montgomery County, TX

E• Calculated the economic impact of expanding a manufacturing facility to produce more energy-efficient lighting in Sarasota, FL

N• Calculated the economic impact of developing facilities for amateur sporting events in northern GA

N• Calculated the economic impact of developing a mixed-use commercial center in Missoula, MT

N• Calculated the economic impact of operating call centers in Las Vegas, NV, and other western Nevada counties

E• Calculated the economic impact of constructing and operating a proton cancer treatment center in Boca Raton, FL

E• Calculated the economic impact of constructing and operating a "Green Box" facility in Detroit to process waste material on a pollution-free basis.

E• Calculated the economic impact of renovating and expanding commercial property in Lower Manhattan

N• Calculated the economic impact of constructing student housing and retail stores in Davie, FL

E• Calculated the economic impact of constructing residential housing near Harvard University

E• Calculated the economic impact of developing mixed-use commercial centers in Broward County, FL

E• Calculated the economic impact of renovating a Dallas apartment building

E• Calculated the economic impact of renovating and operating a nursing home in Las Vegas, NV

E• Calculated the economic impact of constructing a hotel and shopping center in Miami, FL

E• Calculated the economic impact of developing a design center in Miami/Dade county, FL

E● Calculated the economic impact of developing and operating a chain of children's playrooms and party facilities in South Florida

E● Calculated the economic impact of developing a new stadium for the Nets basketball team, to be located in Brooklyn, NY

E● Calculated the economic impact of developing a Marriott hotel in Washington, D.C.

E● Calculated the economic impact of developing and operating a casino for foreign patrons in Las Vegas, NV

E● Calculated the economic impact of operating a series of yogurt fast-food restaurants in South Florida

E● Calculated the economic impact of constructing steel homes and commercial buildings in South Florida

N● Calculated the economic impact of construction and operation of a farm distillery in Vermont

N● Calculated the economic impact of purchase and renovation of deeply discounted residential properties in South Florida

N● Calculated the economic impact of a hotel to be built near LaGuardia Airport in Queens, NY

N● Calculated the economic impact for several mixed-use commercial and residential properties for a regional center covering southern Wisconsin and northern Illinois.

N● Calculated the economic impact for mixed-use commercial project in Flushing, NY

E● Calculated the economic impact for major new hotel near the Washington, D. C. conference center

N● Calculated the economic impact of an assisted living center in suburban Atlanta, GA

N● Calculated the economic impact of an office tower in mid-town Manhattan for the diamond trade

N● Calculated the economic impact of three mixed-use commercial and residential projects in Santa Clara County, CA

N● Calculated the economic impact of six mixed-use commercial and residential projects in Los Angeles, Orange, Riverside, and San Bernardino counties

N● Calculated the economic impact of operating a chain of pizza restaurants in southern Florida.

N● Calculated the economic impact of constructing and operating an assisted living facility in Atlanta, GA

E● Calculated the economic impact of constructing and operating an expansion of University Hospital in Cleveland, OH

E● Calculated the economic impact of a wastewater treatment plant in Victorville, CA

N● Calculated the economic impact of drilling for geothermal energy and constructing and operating power plants in several counties in Nevada

E● Calculated the economic impact of a vacation club operation in Orlando, FL

E● Calculated the economic impact of constructing and operating an extended-stay hotel in Boston, MA

E● Calculated the economic impact of constructing and operating an assisted living facility in Walton County, FL

N● Calculated the economic impact of manufacturing and constructing residential and commercial steel modular buildings in Lee County, FL

E● Calculated the economic impact of a chain of yogurt and juice stores and restaurants in southern Florida

E● Calculated the economic impact of two mixed-use commercial developments in Orange County, CA.

E● Calculated a Targeted Employment Area by census tracts for six counties in the Houston, TX metropolitan area

E● Calculated the expansion of new hybrid car manufacturing facility from Mississippi to Tennessee and Virginia.

E● Calculated the economic impact of construction and operation of a skilled nursing facility in Las Vegas, NV.

N● Calculated the economic impact of construction and operation of a proton cancer treatment center and medical offices buildings in Los Angeles County, CA.

E● Determined the economic impact of improving facilities at the Port of Baltimore in order to attract more shipping from the Panama Canal when the locks are widened.

N● Calculated the economic impact of a major hotel and resort area in Ft. Lauderdale, FL.

N● Calculated the economic impact of building steel homes in South Florida, including the local manufacture of steel fabricated parts.

E● Calculated the economic impact of constructing and operating a hotel at Times Square in New York City.

N● Calculated the economic impact of a mixed-used residential and commercial project in Atlanta, GA.
E● Calculated the economic impact of expanding and opening new restaurants in Dallas, TX. In a separate project, calculated the economic impact of renovating, refurbishing, and operating a boutique hotel in Dallas, TX.

E● Calculated the economic impact of building and operating low-income housing in Boston, MA.

N● Calculated the economic impact of constructing and operating assisted living facilities in eight rural Texas counties.

N● Calculated the economic impact of a mixed-use commercial project in Riverside County, CA.

E● Calculated the economic impact of opening a manufacturing plant for "green" motor vehicles in the Detroit, MI area.

E● Calculated the economic impact of constructing and operating hotels and restaurants in Columbus, MS.

E● Calculated the economic impact of operating restaurants in the Hotel W in Hollywood, CA.

N● Calculated the economic impact of a mixed-use commercial project in McCook, IL (suburban Chicago).

N● Calculated the economic impact of constructing and operating a water-based amusement facility in San Diego, CA.

N● Calculated the economic impact of a mixed-use commercial facility in suburban Cincinnati, OH (project is in KY).

E● Calculated the economic impact of constructing and operating a casino, hotel, and restaurant in Las Vegas, NV.

N● Calculated the economic impact of a new academic institution for alternative energy in Santa Clarita, CA.

N● Calculated the economic impact of several mixed-used projects in San Francisco, Alameda County, Santa Clara County, and Fresno County.

N● Calculated the economic impact of a super energy store and solar farm in Riverside County, CA.

N● Calculated the economic impact of a prostate cancer treatment center in South Carolina.
E● Calculated the economic impact of refurbishing and expanding retail space at the George Washington Bridge in New York City.

E● Calculated the economic impact of building Atlantic Yards, new stadium for the New York Nets, in Brooklyn, NY

N● Calculated the economic impact of an assisted living center and several mixed-use commercial facilities in the Reno, NV area.

E● Calculated the economic impact of buying residential properties at deep discount prices, refurbishing and selling them, in South Florida.

N• Calculated the economic impact for a fractional-ownership marina in Port Charlotte, FL, plus office space, retail stores, restaurants, and a home brokerage office.

N• Calculated the economic impact of construction and operation of four retirement homes in Vermont.

E• Calculated the economic impact of an upscale retail shopping center in Vail, CO. and a medical office building in Edwards, CO (both in Eagle County).

E• Calculated economic impact of a wind turbine manufacturing plant in Larimer County, CO

N• Calculated economic impact of a hotel, retail stores, restaurants, office buildings, and bank facilities in Pasadena, CA

N• Calculated economic impact of a luxury hotel and condominiums in Destin, FL

N• Calculated economic impact of constructing and operating a mixed-use commercial project in Jupiter, FL

E• Determined whether 17 possible restaurant locations in Miami/Dade and Broward Counties qualified as Targeted Employment Areas.

E• Determined the economic impact of opening and operating a slot-machine casino in Hanover, MD, as part of a proposed EB-5 regional center for the Baltimore metropolitan area.

N• Calculated the economic impact of renovating and expanding a restaurant on Martha's Vineyard, MA, as part of an EB-5 regional center in that state.

N• Determined the economic impact of assembling and installing solar panels for residences in the state of LA.
E• Determined a Targeted Employment Area for Dallas, TX as part of a proposed EB-5 regional center for the Dallas area.

N• Calculated the economic impact for various mixed used projects for a proposed regional center for the entire State of Texas, including shopping centers, office buildings, restaurants, assisted living centers, medical technology facilities, and other personal and business services.

N• Calculated the economic impact for the construction and operation of several fast-food restaurants in 10 counties in central California.

N• Calculated the economic impact for the renovation and expansion of a shopping mall in Greenville, SC.

E• Calculated the economic impact of buying existing apartment buildings at deep discount prices, renovating and operating them, in 21 counties in FL.

N• Calculated the economic impact of building and operating an institute for proton cancer therapy for a proposed EB-5 regional center in Brooklyn, NY.

N• Calculated the economic impact of building and operating a mixed-use facility with medical offices, hotels, and apartments for a proposed EB-5 regional center in Queens, NY.

E• Determined a Targeted Employment Area for Philadelphia, PA as part of a proposed EB-5 regional center for the Philadelphia area.

N• Calculated the economic impact of a proposed office building and mixed-use facility for an EB-5 regional center in Dallas, Texas

N• Calculated the economic impact for various mixed-use projects for a proposed EB-5 regional center in the greater New York City area, including an extended stay hotel, urgent care center, financial lending firm for alternative assets, retail stores, apartments, office space, warehouses, industrial "flex" space, entertainment centers, restaurants, conference and convention centers, nursing home and assisted living facilities, medical offices, medical technology facilities, and high-tech manufacturing.

N• Calculated the economic impact of "green" hotels in 10 counties in Central California.

N• Calculated the economic impact of generic projects in manufacturing, financial services, health services, hotels, and restaurants for a proposed regional center for the state of Florida.

E• Calculated the economic impact of 12 different types of economic activity for an expansion of the Palm Beach Regional Center to five contiguous counties.

N• Calculated the economic impact of a new auto parts plant in Alabama to supply parts to Kia automobiles.

N• Calculated the economic impact of opening fast-food restaurants in Miami/Dade and Broward counties in FL.
N• Calculated the economic impact of a mixed-use commercial center in Flushing, Queens County, NY.

E• Calculated the economic impact of revitalizing and renovating part of the Brooklyn Navy Yard for "green" manufacturing facilities.

E• Calculated the economic impact of 12 different types of economic activity for various counties in Charlotte and Sarasota counties, FL

E• Calculated the economic impact of four new manufacturing and distribution companies in Palm Beach County, FL.

N• Calculated the economic impact of developing a resort area and building residences in rural Tennessee.

N• Calculated the economic impact of developing and operating a resort area in Southern Arizona.

N• Calculated the economic impact of revitalizing the depressed East Side of Cleveland, Ohio, with new commercial and industrial buildings.

N• Determined the nationwide economic impact of a $1 billion investment in Mississippi for a new hybrid motor vehicle plant.

N• Determined the economic impact of expanding a shipyard in Southeastern Louisiana.

N• Calculated the economic impact of a new shopping center in Buena Vista, California, and two other generic shopping centers in Los Angeles and San Bernardino counties.

E• Calculated the economic impact of enhancing resort areas in eight rural counties in Colorado.

N• Calculated the economic impact of the rehabilitation of Fitzsimons Village in Aurora, Colorado, by adding an office building with medical labs, hotel, shopping center, and residences.

E• Determined the economic impact of a mixed-use commercial center for the Kansas City metropolitan area.

N• Calculated the number of jobs created for a film production company in New York City.

N• Calculated economic impact of small-scale rooftop solar panels in various counties in California.

N• Calculated economic impact of 7 different types of proposed businesses for a proposed regional center in the Bay Area of California.

N• Determined the economic impact of a new biological research park, office building, and logistics center in Wooster, Ohio.

E• Calculated the economic effect of a mixed-use urban renewal project in Cleveland, Ohio.

N• Calculated economic impact of dairy farm and cheese processing plant in Northern California.

N• Determined economic impact of a shipyard, food processing plant, and semiconductor plant for a proposed regional center in Louisiana and Mississippi.

N• Calculated the economic impact of a new gaming casino in Natchez, Mississippi.

N• Developed an Input/output Model for Guam, which was then used to calculate the economic impact of several generic projects.

N• Calculated the economic impact of a retail shopping center in suburban Los Angeles County.

N• Prepared an economic impact analysis for the "timber to homes" project for a proposed regional center in Colorado.

N• Calculated the economic impact for a proposed regional center in Baltimore, Maryland that would include the rebuilding of depressed areas in East Baltimore and along the riverfront.

N• Prepared the economic analysis for a proposed EB-5 regional center for the entire state of Florida that included impact calculations for 14 different types of industries.

N• Prepared the economic analysis for a proposed EB-5 regional center in the San Francisco Bay area that included calculations for 10 different types of industries.

N• Prepared economic impact calculations for proposed EB-5 regional centers in New York City and Northeastern New Jersey.

• Calculated the economic impact of a rehabilitated office building in Albuquerque, New Mexico, including the increase in high quality jobs.

• Calculated the economic impact of a rehabilitated skilled nursing center in East Los Angeles, California, including the impact on nearby census tracts.

N• Calculated the economic impact of development of warehouse and light industrial manufacturing space in Las Vegas, Nevada.

N• Calculated the economic impact of rehabilitation and expansion of a vacation and health spa in Sharon Springs, New York

N• Calculated economic impact of revitalizing an old resort hotel and adding new facilities for Lake Geneva, WI.

• Calculated the employment and tax effects for a portfolio of projects undertaken under the New Market capital program.

E• Calculated generic employment changes for proposed EB-5 project for an Inland Port in Palm Beach County, FL

N• Calculated the economic impact of construction of El Monte Village in El Monte, CA.

• Calculated the economic impact of moving the Social Security Administration building in Birmingham, AL, and revitalizing the surrounding neighborhood.

• Calculated the economic impact of rehabbing and expanding the Everett Mall in Everett, WA.

• Determined the economic impact of building a new medical center in Charleston, SC

N• Calculated economic impact of expanding Sugarbush resort in VT. Study included expansion of existing facilities and addition of new facilities.

• Calculated economic impact for new market tax credit program in Portsmouth, N.H. Study included both overall economic impact, and the increase in employment and income and the decrease in the unemployment rate and incidence of poverty in individual census tracts.

N• Calculated the economic benefits of EB-5 programs for foreign investors for a mixed-use construction project, including a hotel, retail stores, apartments, and a sports stadium in the Washington, D. C. metropolitan area

N• Calculated the economic benefits of EB-5 programs for a mixed-used retail shopping center in the New York City metropolitan area.

N• Calculated the economic benefits of EB-5 programs for foreign investors for proposed shopping centers in five separate counties in Southern California, including differential impacts of building the shopping centers in different counties.

B. Projects for State and Local Governments

• Constructed an econometric model for the State of New York and determined the change in employment, labor income, and tax revenues for 43 different tax changes proposed by the Governor's office.

• Constructed a detailed econometric model for the State of Pennsylvania to determine the economic impact of the complete panoply of state taxes levied; the model contains over 1,000 equations. In cooperation with American Economics Group, the model was developed to simulate the effect of changes in any state tax rate on households and businesses by income deciles, household status, age of individuals, size of households, and many other demographic variables. The change in business taxes can also be simulated for detailed industry classifications.

• Determined whether the Washington, D.C. water and sewer authority should accept a high bid for a new waste disposal system. Decision to reject has saved the authority over $200 million, as construction prices turned down sharply as predicted.

• Built an econometric model to determine the "tax gap" caused by Internet sales for the state of Minnesota.

• Determined appropriate levels of shelter grants individual counties in New York State, and for utility allowances in New York City. Reviewed and prepared testimony in ongoing court cases in these areas.

• Calculated the economic impact of the revitalization of downtown Milwaukee, Wisconsin.

C. Economic Impact of Casino Gaming

• Built an econometric model to predict the growth of the gaming industry over the next decade, and the economic impact of that industry on employment and tax revenues at the Federal and state levels.

• Estimated the economic impact of Indian casino gaming nationally and for the State of Wisconsin.

• Determined the economic impact of the Oneida Indian gaming casino on the Green Bay metropolitan area.

• Estimated the negative economic impact on the Milwaukee area if a new Indian gaming casino were to be built in Kenosha, Wisconsin.

D. Economic Impact of Smoking Bans and Higher Taxes

• Testified on economic impact of smoking bans in Canada; certified as an expert witness by the Court.

• Examined the impact of smoking bans on restaurant sales in several different locations in the U.S. to determine how much sales changed when these bans were imposed, and the differential effects depending on whether these bans were partial or total.

• Determined the cross-border effects on retail sales from differential rates in cigarette, gasoline, and alcohol excise taxes

• Determined the economic impact of higher cigarette taxes on minority group employment.

• Estimated the economic impact and loss of Federal and state tax revenues when higher cigarette prices lead to increased smuggling.

E. Consulting Projects for Travel and Tourism

• Built an econometric model to predict tourism trips and revenues for the major regions of the U.S. economy.

• Constructed econometric models to predict tourism in Las Vegas and Orlando.

• Using the IMPLAN model, predicted economic impact of tourism and travel expenditures for all counties in Pennsylvania.

F. Other Private Sector Consulting Projects

• Calculated the revenue gain at the Federal, state and local level generated by domestic manufacturing of Airbus parts and equipment.

• Calculated the economic impact of proposed EPA bans on fluoropolymer production.

• Estimated the size and economic importance of the fluoropolymer industry, and calculated economic impact of shutting down domestic production.

• Built an econometric model to examine how U.S. tax and regulatory policies help determine whether the gold mining industry would invest in the U.S. or other countries. Testified before Congress to help defeat legislation inimical to the mining industry.

• Built an econometric model to predict consumer bankruptcies, based on recent growth in consumer credit outstanding, the overall economic environment, and recent changes in credit regulations

• Estimated the economic impact of the ethanol subsidy on the U.S. economy and Farm Belt States, including the impact on the balance of payments, employment, and tax receipts. Testified before Congress to help pass legislation to extent subsidies to the ethanol industry.

• Built an econometric model to determine the impact of updating and improving the system of locks on the Upper Mississippi River on corn prices and exports, farm income, and the overall economy.

THE WORK

A. BEFORE CONSTRUCTION BEGINS.

Before starting construction of the Hotel, Licensee must (at Licensee's sole expense):

1. Submit to Licensor evidence of insurance as required under this License.

2. Submit to Licensor evidence that Licensee is entitled to possession of the premises on which the Hotel will be located, which documents shall be subject to Licensor's approval.

3. Obtain any and all approvals, permits or licenses required for construction to begin.

4. Submit for Licensor's review and approval, Preliminary Plans to Licensor at least two hundred and ten (210) days before Ground Break (no later than **February 1, 2015**) (**"Ground Break"** means the completion of the Hotel building foundation through ground-level or the completion of the finished ground floor slab) starting construction **or such other date as Licensor may agree with Licensee in writing** ("Preliminary Plans" means site plans, building floor plans (all floor levels), and exterior elevations as prepared by a qualified, licensed professional with knowledge of commercial building design and construction, including spatial relationships, and general quality of building systems, elements, products and materials, as is necessary to describe adequately the design of the Hotel).

5. Submit for Licensor's review and approval, Final Plans to Licensor at least one hundred and twenty (120) days before Ground Break (no later than **May 1, 2015**) and before final submittal to Licensee's local building authority **or such other date as Licensor may agree with Licensee in writing** ("Final Plans" means final versions of the Construction Plans and associated specifications including architectural, civil, structural, mechanical, electrical, plumbing, fire protection, landscape and other specialty consultant design documents with such detail and containing such information as Licensor may additionally request). The Final Plans as submitted to Licensor shall conform to then prevailing System standards, including the construction standards set forth in the Standards and address all revisions required by Licensor's review and approval of the Preliminary Plans.

6. Submit to Licensor a pre-construction disability compliance certification signed by an architect with professional experience applying the requirements of the Americans with Disabilities Act ("ADA") and the ADA Standards, in the form of **Attachment C** (the "**ADA Certificate**"). Such certification must confirm the qualifications of the architect and that the Final Plans, as designed, comply with Title III of the ADA and any other applicable accessibility laws, ordinances or requirements.

7. Preliminary Plans and Final Plans to Licensor in Adobe Acrobat PDF format and in paper, "hard copies" standard sized, scaled drawing sheets or such other format as Licensor may specify to Licensee in writing.

B. CONSTRUCTION.

1. Construction shall not begin unless and until Licensor has approved the Final Plans and Licensor has received the properly executed ADA Certificate. Thereafter, no change shall be made to the Final Plans without the prior written consent of Licensor. Notwithstanding the foregoing, after the Final Plans have been approved, if in the course of actual construction any change in the Final Plans occurs, Licensee shall notify Licensor promptly, and in no event later than ten (10) days after Licensee becomes aware of or should have been aware of any such change.

2. Licensee must complete Ground Break of the Hotel by **September 1, 2015.**

3. Licensee must submit for Licensor's review and approval any and all signage, shop drawings, guest room FF &E and common area FF & E plans and associated specifications ("FF & E Specs") to Licensor, as designed and prepared by a licensed or accredited design professional with commercial building design background, no later than thirty (30) days after Ground Break. Thereafter, no change shall be made to the FF &E Specs without the prior written consent of Licensor. Notwithstanding the foregoing, after the FF & E Specs have been approved, if in the course of actual construction any change in the FF & E Specs occurs, Licensee shall notify Licensor and submit changes, within ten (10) days of any such change, for Licensor's review and approval.

4. Licensee shall submit the FF & E Specs to Licensor in the following format: 30" x 24" color boards representing finishes for all guest room/suites and commercial areas with accompanying specifications for all products.

5. Licensee must notify Licensor if it elects to use any Licensor-pre-approved product, design, or FF&E package.

6. Licensee must submit shop drawings, color boards and specifications to Licensor for its review and approval before purchasing and installing any FF & E Specs, including without limitation, any signage.

7. Once the construction has commenced, it shall continue without interruption (except for interruption by reason of events constituting force majeure) until construction is completed.

8. Notwithstanding the occurrence of any events constituting force majeure, or any other cause, construction shall be completed and the Hotel shall be furnished, equipped and shall otherwise be made ready to open for business in accordance with the License not later than **July 16, 2016** (or such other date as Licensor and Licensee may agree in writing).

9. Licensee shall cause the Hotel to be constructed according to the Final Plans and the FF&E Specs approved by Licensor, and Licensor shall determine at its election whether construction has been completed in accordance with the Final Plans and the FF&E Specs.

10. Extension requests to the starting date of construction of a new development may be considered on a basis of monthly increments up to a twelve (12) month period for any one extension. Requests for less than six (6) months must be accompanied by a sum equal to the then current standard minimum Application Fee for the proposed number of rooms for the Hotel, prorated according to the period of time requested. Requests for a six (6) month extension must be accompanied by a sum equal to one half (1/2) of the then current standard minimum application fee for the proposed number of rooms for the Hotel. Requests for extensions of more than six (6) months and up to twelve (12) months must be accompanied by a sum equal to the then current standard minimum Application Fee for the proposed number of rooms for the Hotel. Approval of extension requests is not automatic. The Licensee will be responsible for any and all expenses that may be incurred by Licensor in the processing of an extension request.

11. If an extension request is approved and construction begins within the extension period, the extension fee paid will be refunded, without interest, less the expenses incurred in processing the extension request. If construction does not commence within the extension period, the extension fee will be deemed earned by Licensor and Licensor may, at its election, refund or retain all or any part of the extension fee.

C. OPENING OF THE HOTEL.

1. The Hotel shall not be opened for business under the System unless and until:

    (a) Licensor has approved and accepted, in advance, in writing:

(i) the construction of the Hotel in accordance with the Final Plans and the FF & E Specs and Licensor's requirements;

(ii) the installation of all items of equipment, furniture, signs, computer terminals and related supplies and other items; and

(iii) the staffing and training of such staff necessary to operate the Hotel in accordance with Licensor's requirements;

(b) no accounts of Licensee are past due to Licensor, its parents, subsidiaries or affiliated companies;

(c) Licensee is in full compliance with all of the terms of this License;

(d) Licensee has submitted to Licensor all certificates of insurance (and copies of insurance policies if requested by Licensor) as required under the License;

(e) Licensee has obtained all necessary governmental approvals, licenses and permits to possess, occupy and operate all areas of the Hotel, according to Licensor's requirements, including specifically without limitation, a permanent certificate of occupancy; and

(f) Licensee has submitted to Licensor a post–construction disability compliance certification signed by Licensee and an architect with professional experience applying the requirements of the ADA and the ADA Standards, in the form of **Attachment C** – ADA Certificate. Such certification must confirm the qualifications of the architect, the architect has inspected the as-built conditions of the Hotel and building site and that the Hotel and building site have been built in compliance with Title III of the ADA and any other applicable accessibility laws, ordinances or requirements

2. Notwithstanding anything else herein to the contrary, Licensor may, in its sole judgment, authorize Licensee to open and operate the Hotel as the brand of hotel specified in paragraph 15 of this License, even though Licensee has not fully complied with the terms of this License, provided that Licensee agrees to fulfill all remaining terms of this License on or before the dates established by Licensor as a condition to allowing opening of the Hotel when less than all of the required work has been completed.

3. Licensee acknowledges and agrees that: (a) Licensor's review of Preliminary Plans, Final Plans, FF & E Specs or other materials, documents or items submitted to Licensor for review and approval pursuant to this License (collectively "Licensee's Plans") is exclusively for determination of compliance with the Standards, the requirements of the System and the terms of this License and not for compliance with all applicable law or adequacy or suitability for the purpose intended, (b) no approval of Licensee's Plans by Licensor shall constitute, be deemed or construed in any way as, Licensor's consent, approval, acknowledgment or recognition that Licensee's Plans comply with applicable law or are adequate or suitable for the purpose intended, (c) Licensee shall have the sole responsibility for compliance with applicable law and for the adequacy and suitability for the purpose intended and (d) nothing in this License, and no review and approval (or opportunity for review) by Licensor of Licensee's Plans shall be deemed to create a duty on the part of Licensor that could give rise to any cause of action by Licensee or any of its affiliated entities or persons, or any other person or entity against Licensor or any of its parents, subsidiaries or affiliated entities nor their respective officers, directors or employees, based on any alleged deficiency in the adequacy, suitability or legality of Licensee's Plans.

InterContinental Hotels Group

ACCESSIBILITY CERTIFICATION

Holidex Code: _____

Location #: _____

Hotel Name (as it appears in the IHG Website): _____

Hotel Address: _____

Licensee: _____

This certification is intended to comply with the accessibility standards and/or the Travelers with Disabilities Section of the relevant brand standards as well as the InterContinental Hotels Group Design & Construction standards, all of which require compliance with Title III of the Americans with Disabilities Act (ADA), including the 1991 and/or 2010 ADA Standards for Accessible Design (ADA Standards), and all other applicable accessibility requirements. These standards require as follows:

a. For newly constructed hotels: (1) a pre-construction certification of the final plans for the building and building site submitted prior to the commencement of construction by an architect with professional experience applying the requirements of the ADA and the ADA Standards; and (2) a post-construction certification submitted after an inspection of as-built conditions signed by Licensee.

b. For renovations required for relicensing, conversions, brand changes or changes of ownership: a post-renovation certification submitted after an inspection of as-built conditions signed by Licensee.

c. For voluntary renovations: a post-renovation certification submitted after an inspection of as-built conditions signed by Licensee.

Please select the option for which this Certification is submitted:

☐ **Newly Constructed Hotel** (Must submit Certification Options A & B below)

☐ **Renovation Required for Relicensing, Conversion, Brand Change or Change of Ownership** (Must submit Certification Option B below)

☐ **Voluntary Renovation** (Must submit Certification Option B below)

CERTIFICATION

Please select the Option(s) for which Licensee is submitting this Certification.

☒ Option A: Newly Constructed Hotel - Pre-Construction Certification

The undersigned certifies that (1) he/she is an architect with professional experience applying the requirements of the ADA and the ADA Standards; and (2) the final plans for construction of this building and building site are in compliance with Title III of the ADA and any other applicable accessibility laws, ordinances or requirements, to the best of his/her knowledge, information, and belief.

Name of Architect: Raymond Chan

Name of Firm: Raymond Chan Architect

Signature: _____

Title: Architect Date: _____

☒ Option B: Licensee Post-Construction or Post-Renovation Certification

The undersigned Licensee, to the best of his/her knowledge, information, and belief, certifies that this building and building site have been built, renovated or altered in compliance with Title III of the ADA and any other applicable accessibility laws, ordinances or requirements, including, but not limited to, any accessibility laws or requirements regarding the following:

- The appropriate number and distribution of accessible guest rooms
- Features in accessible guest rooms
- Parking and exterior accessible routes
- Public entrances and interior accessible routes
- Service counters
- Public and common restrooms
- Meeting rooms
- Food and beverage establishments
- Swimming pools, spas, and fitness centers

Name of Licensee Principal Correspondent: George Lu

Signature: _____

Date: _____

By receiving or accepting this Certification, IHG is not confirming that Licensee and/or Licensee's property are in compliance with all applicable federal, state, and local accessibility requirements. Per the relevant license agreement, Licensee is solely responsible for compliance with all applicable accessibility requirements, including the ADA and the 1991 and/or 2010 ADA Standards for Accessible Design.

EXECUTIVE SUMMARY

The Holiday Inn Express & Suites plans to construct and develop a hotel building which consists of a 135-room and suites hotel, including a breakfast room, a fitness room, business center, market pantry, outdoor lounge, and vending areas (the "Project") in Woodside, Queens, one of the five boroughs of New York City. The project is located at 64-06 Queens Blvd in Woodside, New York. This area encompasses some of the most commercially active portions of downtown Flushing, including the majority of Chinese and Korean businesses. It is also a popular destination for Asian tourists. It has an excellent public transportation and roadway network and two major airports, La Guardia Airport and New York JFK Airport. The area surrounding the subject site is characterized by mid-rise apartment buildings, neighborhood businesses, and community facilities. Overall, the supportive nature of the development in the immediate area is considered appropriate for and conducive to the operation of a hotel.

QB Ventures EB5 Capital, LLC will be the new commercial enterprise, (hereinafter the "NCE") a newly formed entity for the purpose of raising EB-5 investment capital. Queens Blvd Ventures, LLC is the job creating entity (hereinafter "JCE") that owns and operates the project. The NCE will be managed by Mr. George Xu, the developer and owner of the Project. The business entity structure is outlined in the table below.

New Commercial Enterprise (NCE)	**QB Ventures EB5 Capital, LLC**
Regional Center (RC)	Century New York City Regional Center, LLC
Job Creating Entity (JCE)	Queens Blvd Ventures, LLC

The Holiday Inn Express & Suites EB-5 Project entails new construction of a hotel building which consists of a 135-room and suites hotel, including a breakfast room, a fitness room, business center, market pantry, outdoor lounge, and vending areas in Woodside, Queens, one of the five boroughs

of New York City. Holiday Inn Express (and Holiday Inn Express Hotel & Suites) is an upper-midscale, limited-service hotel brand by InterContinental Hotels Group (IHG). The construction and operation of the regional base of invested capital, the creation of new jobs, and the associated economic growth effects will be put into effect with the capital raised from immigrant investors through the EB-5 Program.

The NCE is seeking to raise a maximum of [redacted] in investor capital from [redacted] EB-5 investors for the EB-5 Immigrant Investor Program (hereinafter "EB-5") for the The Holiday Inn Express & Suites. According to the Economic Impact Report, the project will create [redacted] jobs, including [redacted] obs from direct and indirect from construction employment, and [redacted] jobs from hotel operations [redacted] direct jobs from operation, and [redacted] indirect jobs from operation).

LOCATION – TARGETED EMPLOYMENT AREA

The EB-5 investment within a targeted employment area is calculated at a ratio of $500,000 for every 10 jobs created. The maximum credited foreign investment the [redacted] jobs could support under the EB-5 Program is [redacted] capital raise. The Project is seeking to raise [redacted] from the EB-5 Program.

The project is located at 64-06 Queens Blvd in Woodside, NY 11377 . The location is in census tract 245 in Queens County, a designated Targeted Employment Area ("TEA") as of August 20, 2015, confirmed by the Empire State Development and New York State Department of Labor. Please see the TEA letters, attached at **Exhibit 4.**

Therefore, each EB-5 investor will be required to invest a minimum of $500,000 into the NCE.

DEVELOPMENT COSTS:

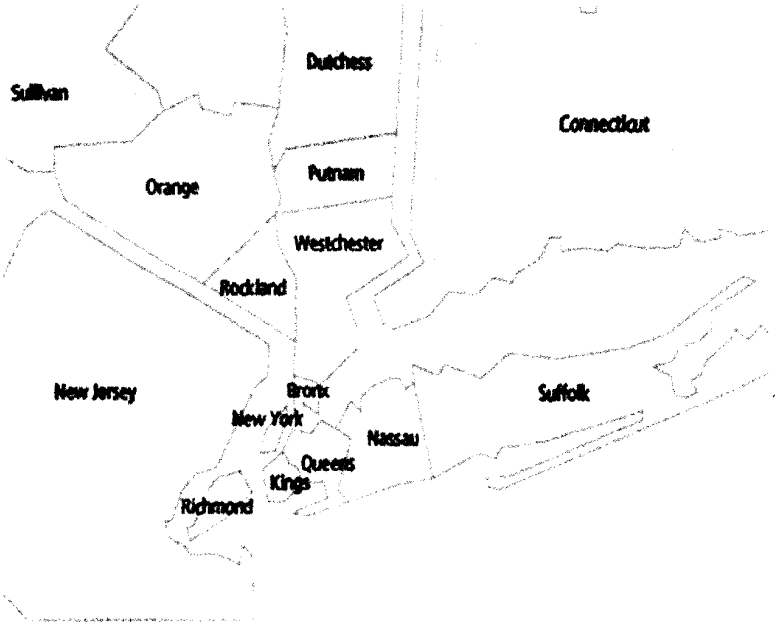
The total cost of the Project is estimated at [redacted] consisting of land costs of approximately [redacted] hard construction costs of approximately [redacted] and soft and other costs of approximately [redacted] The owner's equity in the Project is [redacted] which is approximately [redacted] of the development costs. The Project is seeking to raise [redacted] n EB-5 investment funds. The Project is currently negotiating with banks to provide a senior loan in an amount up to [redacted] As one of Queens' most active real estate developers that has completed projects valued at over [redacted] the project's principal is very well positioned to obtain a senior loan in this amount.

REGIONAL CENTER:

QB Ventures EB5 Capital, LLC ("NCE") is managed by Century New York City Regional Center, LLC. The Regional Center was designated as a "regional center" on May 14, 2015. The NCE was organized as a New York Limited Liability Company on March 31, 2014 with the primary business objective to raise EB-5 capital to fund real estate development projects such as the Holiday Inn Express & Suites located at 64-06 Queens Blvd in Woodside, New York. The project is owned by the project developer and JCE, Queens Blvd Ventures, LLC. Mr. George Xu is the principal of Queens Blvd Ventures, LLC.

GEOGRAPHIC SCOPE:

The Holiday Inn Express & Suites is located in Queens County. The RC requests the following seven (7) counties to be included in the RC's geographic boundaries: Queens County, New York County, Kings County, Bronx County, Richmond County, Westchester County and Nassau County. Please see the County map below.



Pursuant to the Policy Memorandum on EB-5 Adjudications Policy (PM-602-0083), an amendment requirement is not required if investment opportunities arise outside the geographic area referenced above.

NAICS CODES:

The RC development project requests designation in the following industries based on the North America Industry Classification System **("NAICS")** Code:

Construction Hard Costs

- Construction (Building & Site) – 2362/23622
- Wholesale Trade (FF&E) – 42/4232
- Hotel and Motel (including Casino) – 72251
- Food Services and drinking places – 72251
- Real Estate – 53112/5313

Financing & Soft Costs

- Other government enterprises – 921
- Architectural, engineering and related services – 5413
- Insurance - 5241
- Accounting tax preparation, bookkeeping services – 5412
- Legal Services – 5411
- Monetary authorities and depository credit intermediation – 5222
- Other miscellaneous professional and technical services - 5419

SECTION I: THE BUSINESS

OVERVIEW OF THE EB-5 PROJECT
DESCRIPTION OF THE BUSINESS; SERVICES & OBJECTIVES

THE HOLIDAY INN EXPRESS & SUITES

The Holiday Inn Express & Suites EB-5 Project entails the construction of a hotel buidling which consists of a 135-room and suites hotel, including a breakfast room, a fitness room, business center, market pantry, outdoor lounge, and vending areas in Woodside, Queens, one of the five boroughs of New York City. The Holiday Inn Express & Suites is an upper-midscale, limited-service hotel brand by InterContinental Hotels Group (IHG), offering a full-service hotel experience at a reasonable price.

The Holiday Inn Express & Suites is located in Woodside, Queens in New York City. The project site is located at 64-06 Queens Blvd in Woodside, New York 11377. The location is designated as a targeted employment area ("TEA") as of August 20, 2015. The Holiday Inn Express & Suites will feature 135 rental units, including a breakfast room, a fitness room, business center, market pantry, outdoor lounge, and vending areas. The eight-story property will open on March 1, 2018.

Holiday Inn Express (and Holiday Inn Express Hotel & Suites) is an upper-midscale, limited-service hotel brand by InterContinental Hotels Group (IHG). According to IHG, Holiday Inn Express is one of the fastest growing hotel brands in its segment. Holiday Inn Express offers competitive rates for both business and leisure travelers. All locations provide the complimentary "Express Start" breakfast bar, and many locations offer recreational amenities such as a swimming pool and/or fitness room. As of year-end 2014, there were 2,060 properties spanning 182,601 rooms in the Americas. In 2014, Holiday Inn Express hotels operated at an average occupancy rate of 68.5%, with an average daily rate of $108.48 and an average RevPAR of $74.26 in the Americas.

PROJECT LOCATION AND TARGET EMPLOYMENT AREA

The project is located at 64-06 Queens Blvd in Woodside, New York 11377. The location is in census tract 245 in Queens County, a designated Targeted Employment Area ("TEA") as of August 20, 2015, confirmed by the Empire State Development and New York State Department of Labor. Please see the TEA letter, attached at **Exhibit 4.** Therefore, each EB-5 investor will be required to invest a minimum of $500,000 into the NCE.

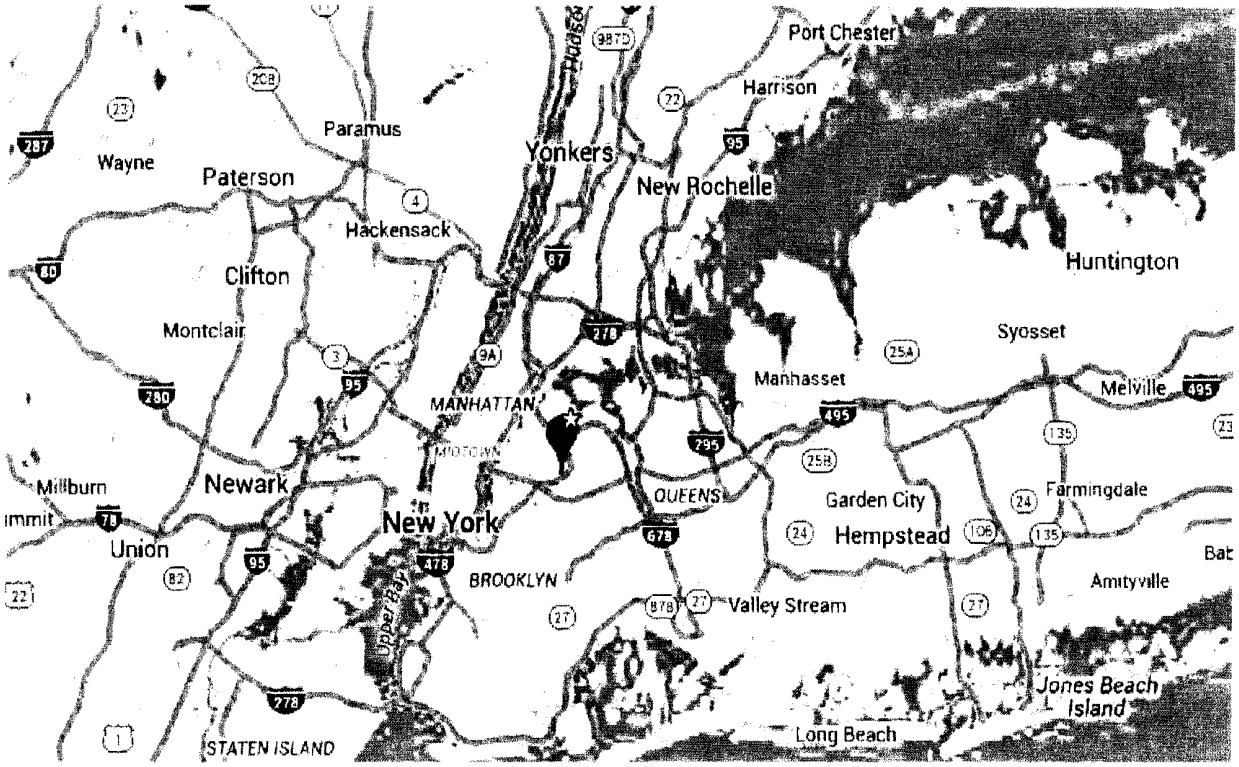
The Project Location



The Woodside, Queens neighborhood surrounding the proposed property is characterized by a densely developed mixture of retail and commercial space that is proximate to an excellent public transportation and roadway network and two major airports, La Guardia Airport and New York JFK Airport. This area encompasses some of the most commercially active portions of downtown Flushing, including the majority of Chinese and Korean businesses located in Flushing.

Woodside is primarily a residential neighborhood in the western portion of the New York City borough of Queens. It is bordered on the south by Maspeth, on the north by Astoria, on the west by Sunnyside and on the east by Elmhurst and Jackson Heights. The area surrounding the subject site is characterized by mid-rise apartment buildings, neighborhood businesses, and community facilities. Overall, the supportive nature of the development in the immediate area is considered appropriate for and conducive to the operation of a hotel.

SECTION II: MARKET ANALYSIS

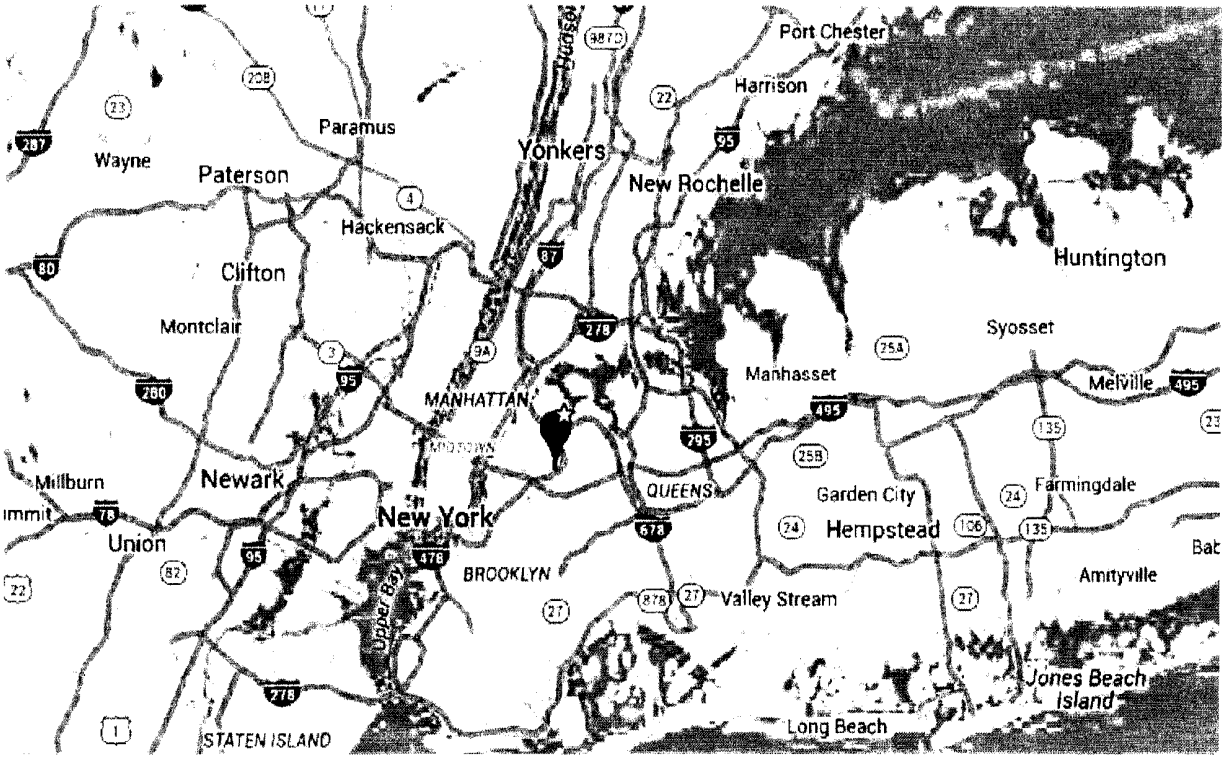
This section includes the analysis of the target market, perspective customers, market demand and analysis method, and the project's competitive advantages and highlights.

Source of the data: The market analysis is provided by HVS Consulting and Valuation Services ("HVS"). HVS is the world's premier hotel consulting and valuation firm, known for their impeccable worldwide reputation for credibility, excellence, and thoroughness. They provide full services and solutions on consulting and valuation; executive search; investment banking; asset management and strategic advisory; hotel management; convention, sports, and entertainment facilities consulting; design; shared ownership; parking; gaming; golf; sustainability; risk management; and property tax. HVS is the industry's primary source of hotel sales data, research, market studies, and educational information relating to the hospitality industry.

HVS was established in 1980 by Chairman and Founder Steve Rushmore, MAI, FRICS, CHA, and now directed by President and CEO Stephen Rushmore, Jr., MAI. HVS are members of:
MAI: Member of the Appraisal Institute
CHA: Certified Hotel Administrator
FRICS: Fellows of Royal Institution of Chartered Surveyors

LOCATION

The Project, The Holiday Inn Express & Suites , is located in Woodside, New York. Located proximate to Brooklyn Queens Expressway (BQE – Interstate 278), it connects the subject site to various parts of Brooklyn, Queens, and Bronx, and provides accesses to other major thoroughfares such as Long Island Expressway (LIE) and Grand Central Parkway. Access to Manhattan is easily accomplished via the westbound Queens Boulevard and crossing the QueensboroBridge (also known as the 59th Street Bridge). Alternatively, motorists may access Manhattan via the LIE and the Midtown Tunnel. The project is also served by other accessible transportation offerings, including the Long Island Rail Road and New York City's extensive subway system. The closest subway station is located approximately one half mile north of the subject site, providing access to the 7 Train, which runs between Times Square, Manhattan and Main Street, Flushing. Overall, access to the subject site is considered to be adequate.



Map of Regional Access Routes

Aerial View of the Proposed Area

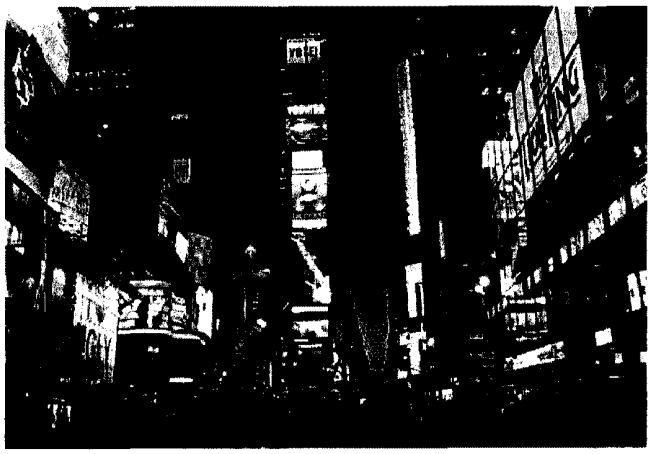
Renowned for its cultural attractions, entertainment, restaurants, and retail outlets, New York City is one of the most popular tourist destinations in the country. The city is recognized as an international commercial and cultural center. It is home to the United Nations, the Statue of Liberty, and the Empire State Building. The theaters in the Broadway district attract international attention. Lincoln Center (the home of the Metropolitan Opera, the New York Philharmonic, the New York City Ballet and Opera, and the Juilliard School) is among the world's most important centers for the performing arts. The Metropolitan Museum of Art, the Museum of Modern Art, the American Museum of Natural History, and a number of the city's other museums and galleries are internationally respected.

In the borough of Queens lies the Flushing Tennis Center, home of the U.S. Open; CitiField, home of the New York Mets baseball team; and Flushing Main Street, a vibrant, bustling district for shopping and restaurants. Brooklyn is also home to some of New York's most famous attractions including Coney Island, the Barclays Center, and the Brooklyn Academy of Music, as well as numerous shops and restaurants in the Williamsburg neighborhood. Directly to the north of midtown Manhattan lays Harlem, home to the world-famous Apollo Theatre as well as numerous renowned educational institutions including Columbia University and City College. Further north is the borough of the Bronx, home to Yankee Stadium, the venue for the New York Yankees baseball team, and numerous concerts and events; and the immensely popular Bronx Zoo.

Major Destinations & Attractions

New York City is one of the most popular and frequently visited destinations in the United States. A few of the major attractions include:

Times Square: a major intersection at the junction of Broadway and Seventh Avenue and stretching from West 42nd to West 47th Streets. It boasts attractions such as ABC's Times Square Studios, where Good Morning America is broadcast live, elaborate Toys "R" Us, Virgin Records, and Hershey's stores, as well as restaurants such as Ruby Foo's, the Bubba Gump Shrimp Company, Planet Hollywood Restaurant



and Bar and Carmine's along with a number of multiplex movie theaters. It has also attracted a number of large financial, publishing, and media firms to set up their headquarters in the area including Ernst and Young, Reuters, New York Times, Barclays, Morgan Stanley, among many others.

Jacob K. Javits Convention Center is a large convention center at Eleventh Avenue on the west side of Manhattan. The exhibit space is over 675,000 square feet. On October 16, 2006, a groundbreaking ceremony was held to start construction of an expansion.

New York Cruise Piers is a world-class ship port situated on West 52nd Street, and offers ideal facilities for cruise arrivals and departures. New York Cruise brings the most spectacular—often the fastest, biggest, and most luxurious—passenger ships to the West Side of Manhattan.

Lower (Downtown) Manhattan

The Financial District contains an assortment of businesses, ranging from small retail shops to chain-affiliated department stores to financial houses and educational buildings. The area is primarily commercial in character and is home to the New York and American Stock Exchanges, the WTC Site, and the World Financial Center.

In addition, several large corporations have their headquarters in the area, such as Goldman Sachs, The Bank of New York, Deutsche Bank, the Federal Reserve Bank of New York, and many more. The close proximity of high-grade office space and associated services makes the area an attractive location for lodging facilities.

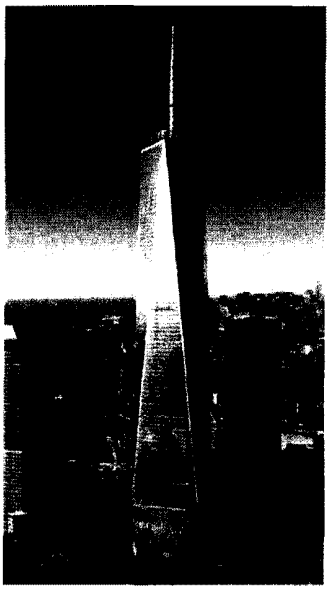
While modern-day business is the focus of Lower Manhattan, the market's historic representation makes the area unique. Among the historic attractions are Manhattan's oldest church, Trinity Church/St. Paul's Chapel, a national landmark built in 1766; Fraunces Tavern, which was built in

1719 and is the place where George Washington bade farewell to his officers; and the Federal Hall Memorial, the site where George Washington took the oath as America's first president.

Other points of interest in the Downtown area include the South Street Seaport, Battery Park, and the Federal Reserve Bank, to name a few. Access to the Statue of Liberty and Ellis Island is also provided from Battery Park, and represents some of the most important tourist attractions in New York City.

Lower Manhattan is expected to go through somewhat of a renaissance, fuelled by the redevelopment of the World Trade Center (WTC) site and the construction of a new transit station that will serve the transportation needs of Lower Manhattan.

World Trade Center Redevelopment

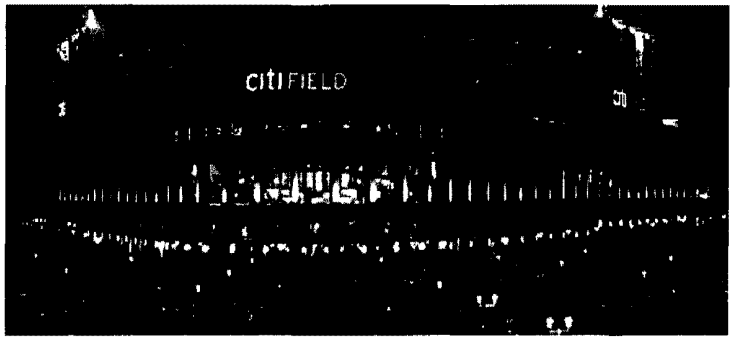


The WTC site now includes Tower 7, which was completed in May 2006 and developed by Silverstein Properties. Additional plans for the World Trade Center include the following. Please note that all data presented in relation to the WTC redevelopment has been sourced through the Lower Manhattan Development Corporation (LMDC).

- Four new skyscrapers (1 WTC, Freedom Tower; Towers 2, 3, and 4)
- National September 11 Memorial & Museum at the World Trade Center
- World Trade Center Transportation Hub
- Retail Complex
- Performing Arts Center

Attractions in Flushing, Queens

In addition to the Flushing Tennis Center and CitiField, Queens also hosts Queens Zoo, Aqueduct Racetrack, Flushing Town Hall-Concert Hall, Queens Botanical Garden, Louis Armstrong House & Archives, and others.



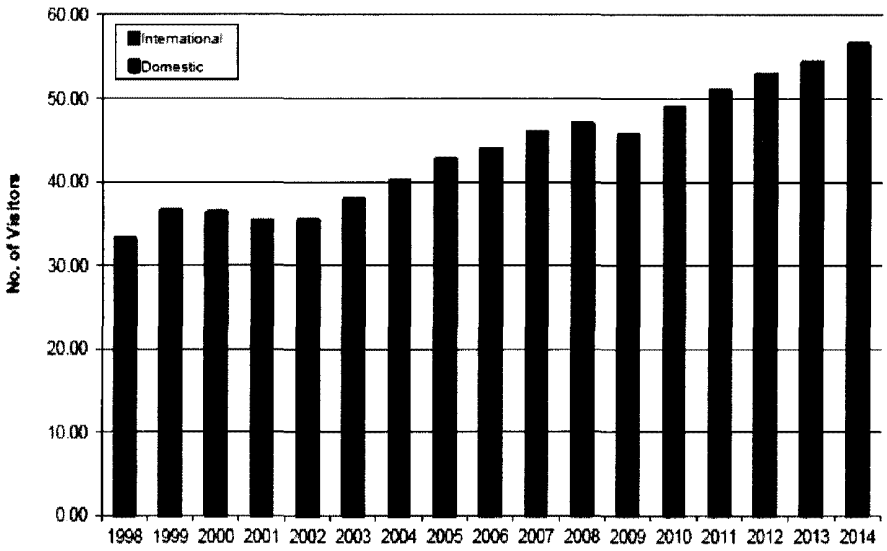
Queens is one of the most ethnically diverse communities in the U.S. The Borough of Queens is home to more than 34,500 businesses, ranging from small retail outlets to large manufacturing plants. The project area encompasses some of the most commercially active portions of downtown Flushing, including the majority of Chinese and Korean businesses located in Flushing. Located one block from Main Street, the major thoroughfare in Flushing, the hotel is in an area known as "Chinese Flushing." The majority of the area's banking institutions, department stores, and office spaces are located on or near Main Street. A majority of the buildings and businesses are owned and patronized by the Chinese residents of the area; therefore, the neighborhood presents a fairly homogenous Asian image. Consequently, this area is a popular destination for Asian tourists who appreciate these somewhat familiar surroundings.

MARKET DEMANDS AND ANALYSIS METHOD

New York City is one of the most popular and frequently visited destinations in the United States. In 2013, New York City is estimated to have accommodated roughly 54.3 million visitors – a record level. Of the overall visitation figure, roughly 11.4 million hailed from international markets, maintaining the City's rank as the number one U.S. destination for overseas travelers. City officials estimate the overall economic impact of tourism in 2013 to be $58.7 billion. Direct visitor spending was estimated to be $39.4 billion, up from $36.9 billion in 2012.

According to most market observers, such record levels could not been realized without the expanded availability of hotel rooms in New York City. In fact, as illustrated by the tourism data in the following, the four highest tourism levels have all been recorded over the past four years – the period of highest availability of inventory in the market. As illustrated in the graph below, the three highest tourism levels have all been recorded over the past three years – the period of highest availability.

FIGURE 5-3 NEW YORK CITY – HISTORICAL TOURISM LEVELS (NYC & COMPANY)



After a period of economic contraction, the market area has entered into a period of expansion and recovery following the Great Recession. HVS' market interviews and research revealed that although the area was affected by slowing business levels, a depressed housing market, and reduced levels of discretionary spending during the downturn, the market benefits from a well-established and diversified economy, which has aided in the recovery. The LaGuardia Airport and the close proximity to Manhattan has remained the cornerstones of this market, generating consistent demand throughout the year. Based on their market research, HVS are expecting market condition to continue improving in the near future.

Manhattan Lodging Market

Over the last 25 years, the Manhattan lodging market experienced minimal growth in supply, as a result of strong barriers to entry prevailing in that market. From 2004 through 2006, supply actually decreased due to the conversion of several hotels to condominiums. Since early-2009, the market has consistently registered strong increases in supply each month. From January 2009 to March 2013, supply increased by 19.8 percent.

As a result of the supply and demand dynamics, the market has been historically undersupplied. Over the last 25 years, average annual demand growth, at 2.1 percent, has outpaced corresponding growth in supply, at 1.7 percent. The Manhattan lodging market represents one of only five major markets among the top 25 in the U.S. to have maintained such a positive differential between supply and demand over the same period.

Periods of economic recovery and expansion are characterized by strong ADR growth. The Manhattan market experienced 27 consecutive months of double-digit increases in ADR from January 1997 to March 1999, and 46 consecutive months from November 2004 to August 2008. The market experienced the strongest ADR growth during the expansion period following the 2001 recession, which coincided with decreases in supply. As of March 2013 the market had experienced only one month of double-digit increase in ADR, in March 2011, at 10.1 percent. The significant amount of new supply that had entered the market since early 2009 did not have any effect on occupancy levels; however, the additional inventory limited the ability for hotel operators to push the average rate. Double-digit increases in ADR through 2015 are unlikely with a further anticipated increase in supply of approximately 15.0 percent over the same period.

Since 1987, RevPAR has increased at a healthy average annual rate of 4.2 percent. Periods of economic recovery and expansion are characterized by strong RevPAR growth. The Manhattan market experienced 57 consecutive months of double-digit increases in RevPAR from June 1994 to February 1999, and 53 consecutive months from May 2004 to September 2008. RevPAR percent change peaked in February 2005 at 22.2 percent. Percent change in RevPAR bottomed out at -27.3 percent in October 2009 as opposed to -24.4 percent in July 2002. However, RevPAR rebounded faster and stronger following the most recent recession than after the previous two contractions, primarily fueled by ADR gains.

As of March 2013 the market had experienced only 6 months of double-digit increase in RevPAR, from November 2010 to April 2011. Double-digit increases in RevPAR through 2015 are unlikely as occupancy is forecast to remain relatively stable, in the mid-80's, and ADR is anticipated to experience single-digit growth over the same period. As such, more moderate RevPAR growth is expected during these recovery and expansion periods than after the previous two economic recessions. A total of 89 new hotels opened in Manhattan between March 2008 and April 2013, adding 15,799 rooms to the market and representing growth of 23.7 percent over the February 2008 level. Approximately 75.0 percent of the new supply entered the market from March 2008 to December 2010. This addition is the largest increase in supply over the last 25 years.

The timing of the opening of the new supply coincided with the latest recession and the start of the recovery. Nevertheless, this large influx of new hotels had a minimal effect on the occupancy of the existing properties. As the economic recovery continues, HVS anticipates that the additional new supply will be absorbed into the market. Consequently, the Manhattan lodging market is expected to remain undersupplied. Market-wide occupancy is expected to remain close to maximum-level capacity, in the mid-80 percent range, through 2015. New supply is expected to

increase by approximately 15.0 percent by 2015. As a result, HVS forecasts moderate average rate growth over the next three years. From 2013 to 2015, HVS forecasts relatively modest increases in RevPAR, primarily driven by ADR growth. Overall, RevPAR is forecast to appropriately recover and surpass its pre-recession (2008) in 2014. Increases in supply are expected to be readily absorbed and thus are not anticipated to significantly affect the recovery. Reflective of such trends, the Manhattan lodging market seemingly remains poised for a strong recovery, irrespective of any forthcoming increases in supply.

Queens Lodging Market

Queens is one of the most ethnically diverse communities in the U.S. It has served as a bedroom community for Manhattan, but has also developed its own employment base. The two major airports, JFK International and LaGuardia, have played an important role in shaping the area's economy. The Borough of Queens is home to more than 34,500 businesses, ranging from small retail outlets to large manufacturing plants. No single company or industry is dominant, although health care, air transportation, and services are major sectors. Some of Queens' largest employers include Steinway & Sons, British Airways, St. John's University, and Citibank.
More than 59% of Queens's residents commute to Manhattan for work. Of the 41% of workers who remain in Queens for employment, 32% work in the services industry, 21% in retail, 15% in public utilities, 11% in manufacturing, 8% in government, 7% in construction, and 6% in FIRE (finance, insurance, and real estate).

Although Queens has never been a major center for office development, the retail sector has benefited from the area's concentration of residential developments. Downtown Jamaica, which is located north of the subject property, in central Queens, is one of the largest concentrations of retail space in New York City, attracting visitors from throughout the region, owing to the appealing prices offered by the local merchants. However, Queens still exports a disproportionate share of its retail spending to neighboring Manhattan and Nassau County.
While not as rich in tourist attractions as Manhattan, the Borough of Queens offers its own array of leisure-oriented sites.

The following table lists selected visitor attractions located in Queens.

FIGURE 5-1 SELECTED QUEENS VISITOR ATTRACTIONS

Attraction	Type	Location	Notes
Citi Field	Sports	Flushing	Home baseball park of New York Mets
Flushing Meadows-Corona Park	Park	Corona	Home of the 1954 World's Fair, featuring a zoo, a boating lake, a skate park, a barbecue area, playfields, and an aquatic and hockey center.
Louis Armstrong House Museum	Museum	Flushing	Music, photos, films, instruments, awards
MoMA PSA	Museum	Long Island City	contemporary art museum showcases new and innovative work
Museum of the Moving Image	Museum	Astoria	high-tech museum dedicated to multimedia arts, with a particular emphasis on film
New York Hall of Science	Museum	Corona	450-exhibit, hands-on science center
Queens Botanical Garden	Garden	Flushing	Acres of plantlife, including a Japanese Garden
Queens County Farm Museum	Museum	Floral Park	47 acres, including a historic farmhouse, as well as livestock and planting fields
Queens Zoo	Zoo	Flushing	11-acre zoo with North American wildlife
Resorts World Casino	Casino	Jamaica	Up to 5,000 slots and electronic table games and a variety of dining and shopping options
Socrates Sculpture Park	Park	Long Island City	Specifically designated for artists to create outdoor works, with views of Manhattan skyline
USTA National Tennis Center	Sports	Flushing	Home of U.S. Open

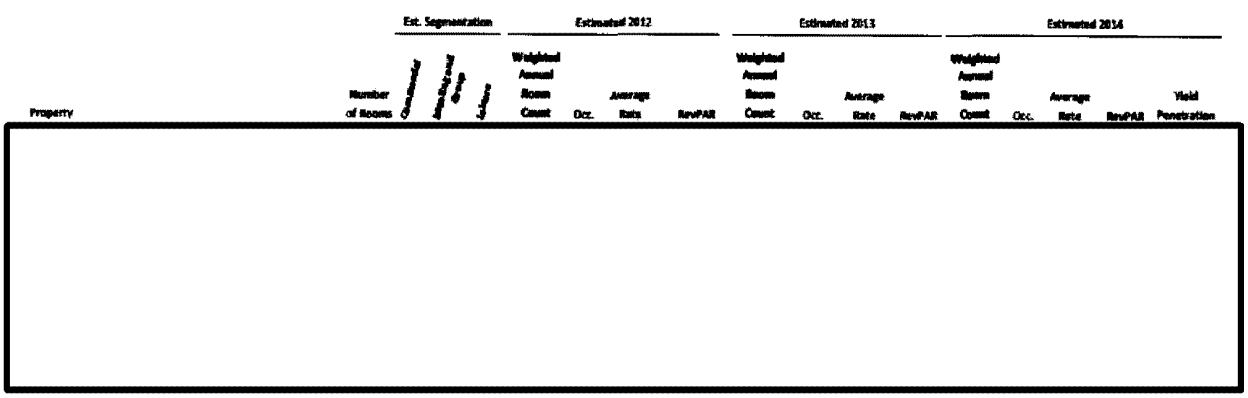
2012-2014

FIGURE 7-3 COMPETITORS – OPERATING PERFORMANCE



(b)(4)

The Lodging Industry

In the lodging industry, price varies directly, but not proportionately, with demand and inversely, but not proportionately, with supply. Supply is measured by the number of guestrooms available, and demand is measured by the number of rooms occupied; the net effect of supply and demand toward equilibrium results in a prevailing price, or average rate. Smith Travel Research (STR) is an independent research firm that compiles and publishes data on the lodging industry, and this information is routinely used by typical hotel buyers. The 210-room Proposed Four Points Flushing will be located in Flushing, New York. The greater market surrounding the subject property offers a variety of lodging facilities. Of this larger supply set, the subject property competes with a smaller set of hotels based on various factors. These factors may include location, price point, product quality, length of stay (such as an extended-stay focus vs. non-extended-stay focus), room type (all-suite vs. standard), hotel age, or brand, among other factors.

HVS has reviewed these pertinent attributes and established a competitive set based upon this review. STR has compiled historical supply and demand data for a group of hotels considered applicable to this analysis for the proposed subject property. This information is presented in the following table, along with the market-wide occupancy, average rate, and rooms revenue per available room (RevPAR). RevPAR is calculated by multiplying occupancy by average rate and provides an indication of how well rooms revenue is being maximized. A review of the trends in occupancy, average rate, and RevPAR per day of the week over the past three fiscal years provides some insight into the impact that the current economic conditions have had on the competitive lodging market. Considering the subject market's historical performance and potential supply growth, HVS has stabilized the market-wide occupancy at approximately 76% in 2019, when all the proposed new supply is appropriately absorbed into the market.

Branding:

Holiday Inn Express (and Holiday Inn Express Hotel & Suites) is an upper-midscale, limited-service hotel brand by InterContinental Hotels Group (IHG). According to IHG, Holiday Inn Express is one of the fastest growing hotel brands in its segment. Holiday Inn Express offers competitive rates for both business and leisure travelers. All locations provide the complimentary "Express Start" breakfast bar, and many locations offer recreational amenities such as a swimming pool and/or fitness room. As of year-end 2014, there were 2,060 properties spanning 182,601 rooms in the Americas. In 2014, Holiday Inn Express hotels operated at an average occupancy rate of 68.5%, with an average daily rate of $108.48 and an average RevPAR of $74.26 in the Americas.

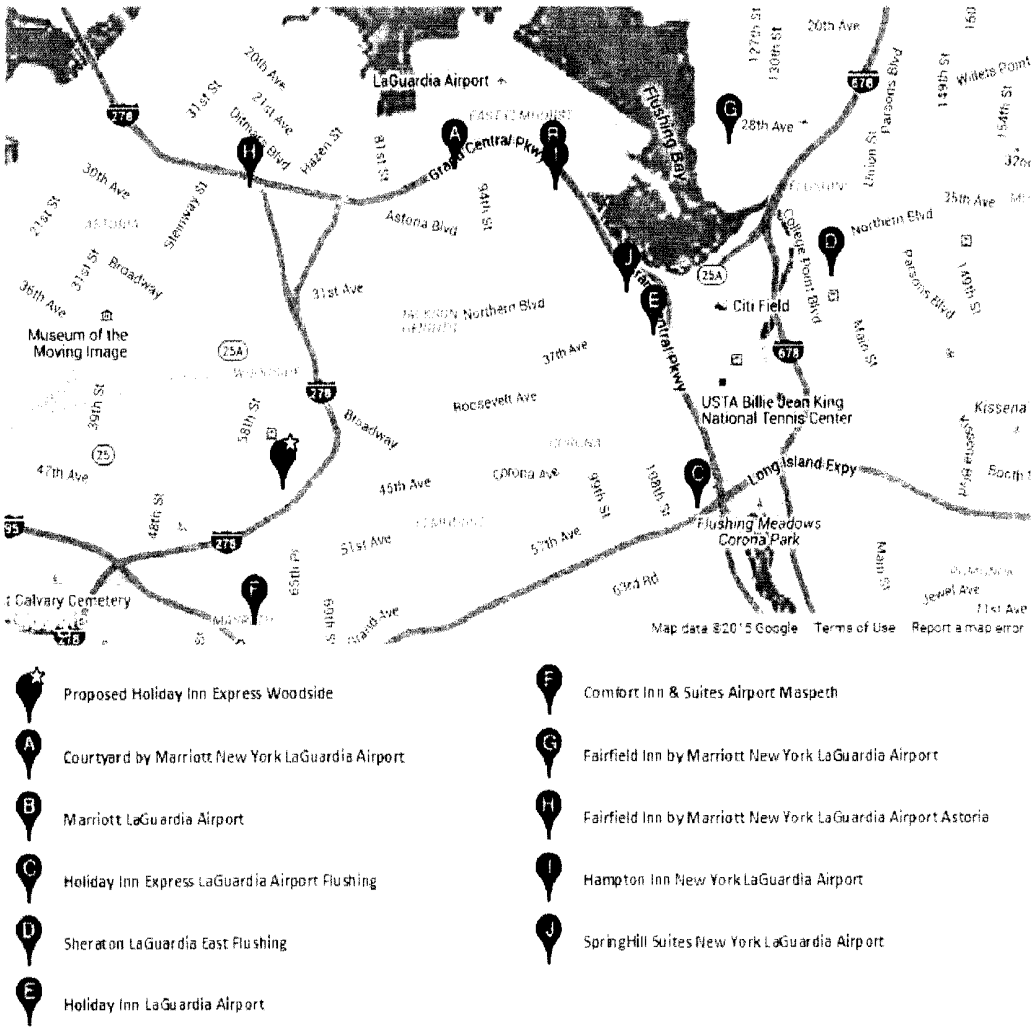
PROJECT HIGHLIGHTS:

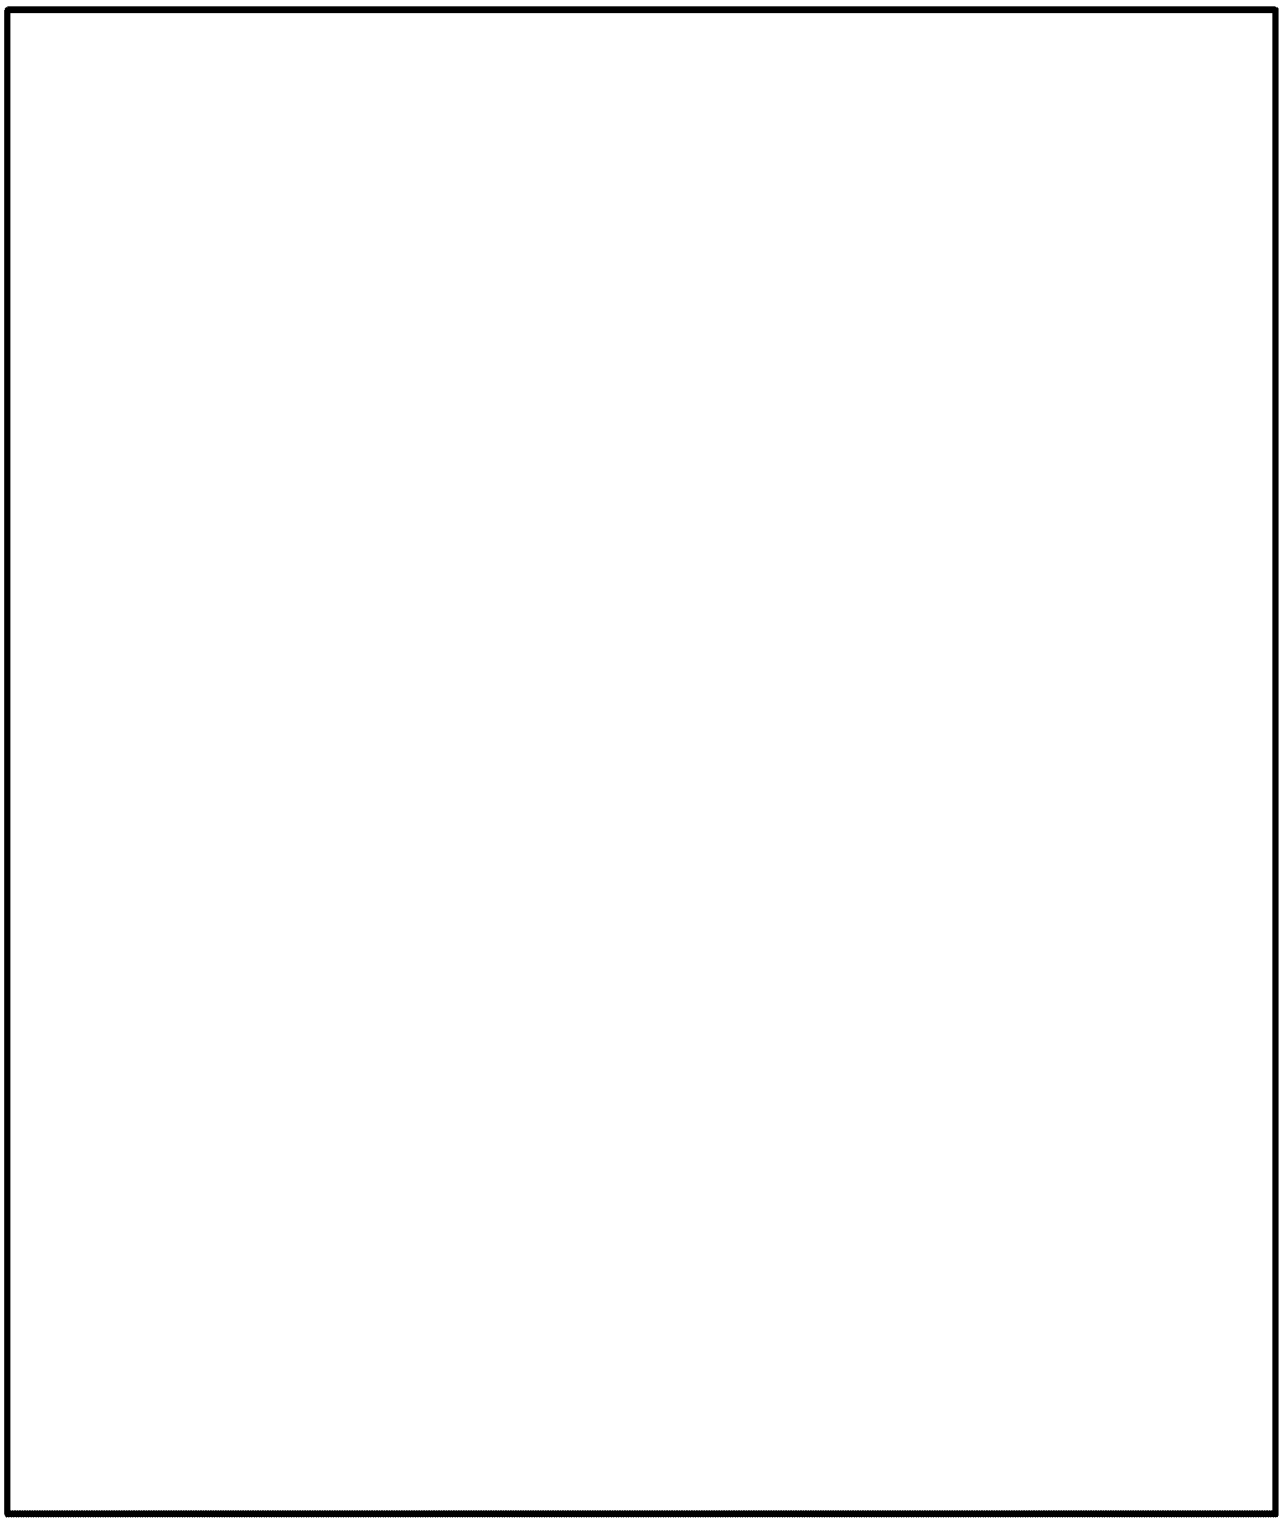
- Close proximity to Manhattan, New York (15 minute train ride on the 7 train)
- Proximity to Queens Shopping Center, and major commercial and residential areas
- Proximity to two major airports (LGA & JFK) in New York City
- Holiday Inn Express, an upper-midscale hotel brand offering a full-service hotel experience at a sensible price
- Century Construction Group is an established developer in NY
- 135-rooms, including 2 suites, a breakfast room, a fitness room, business center, market pantry, outdoor lounge, and vending areas.
- 16,050-square-foot lodging facility space

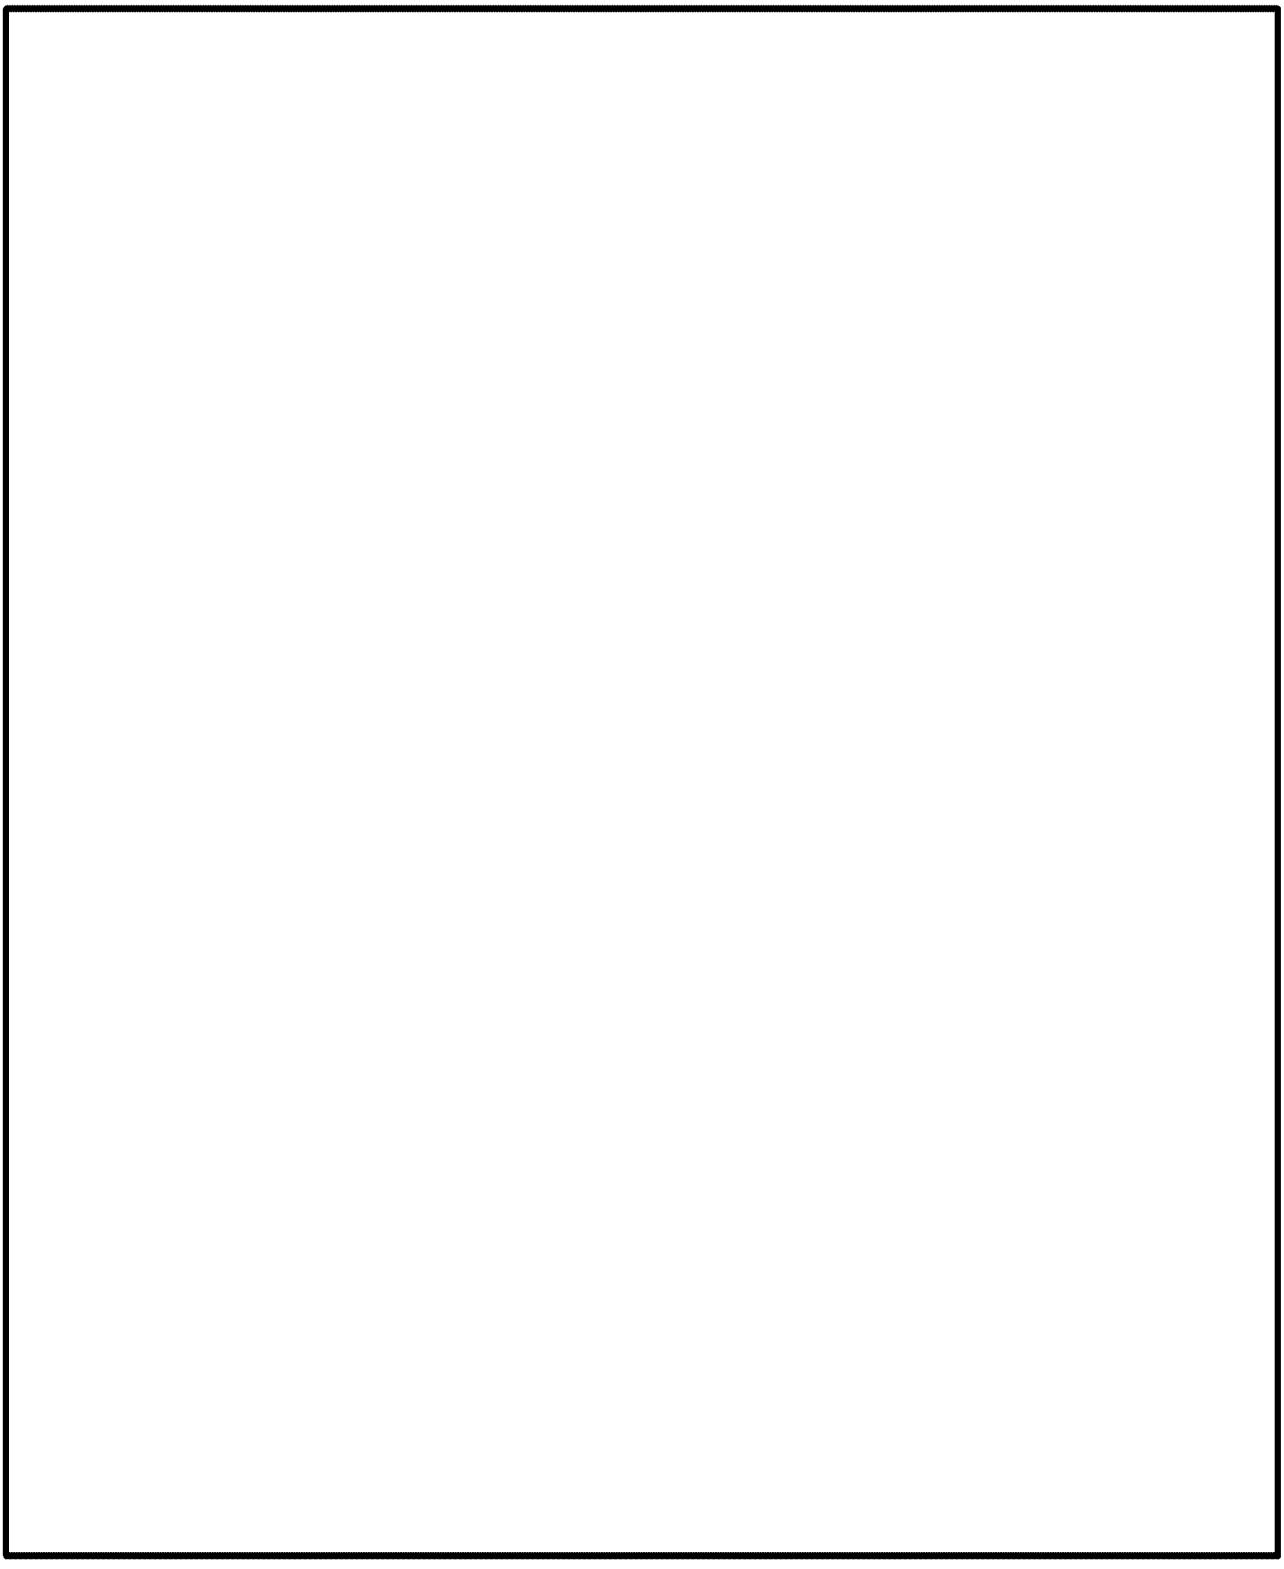
The following map illustrates the locations of the subject property and its future competitors:

MAP OF COMPETITION

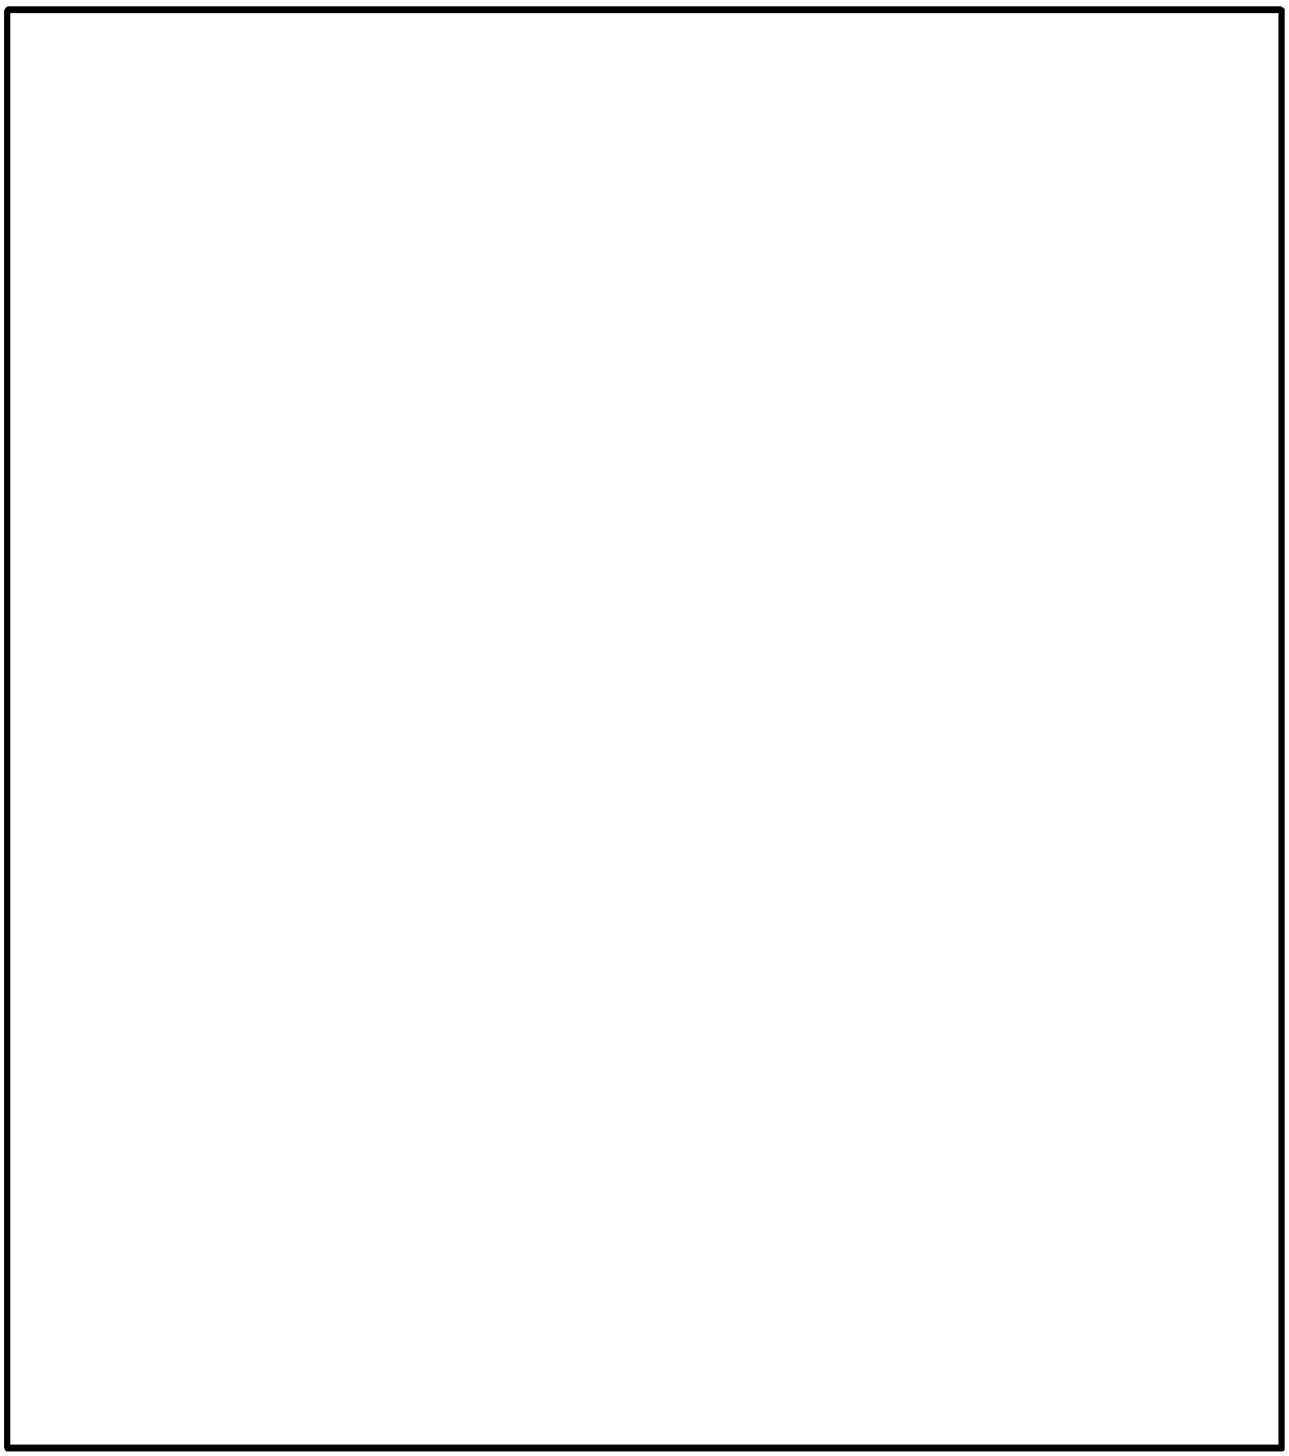


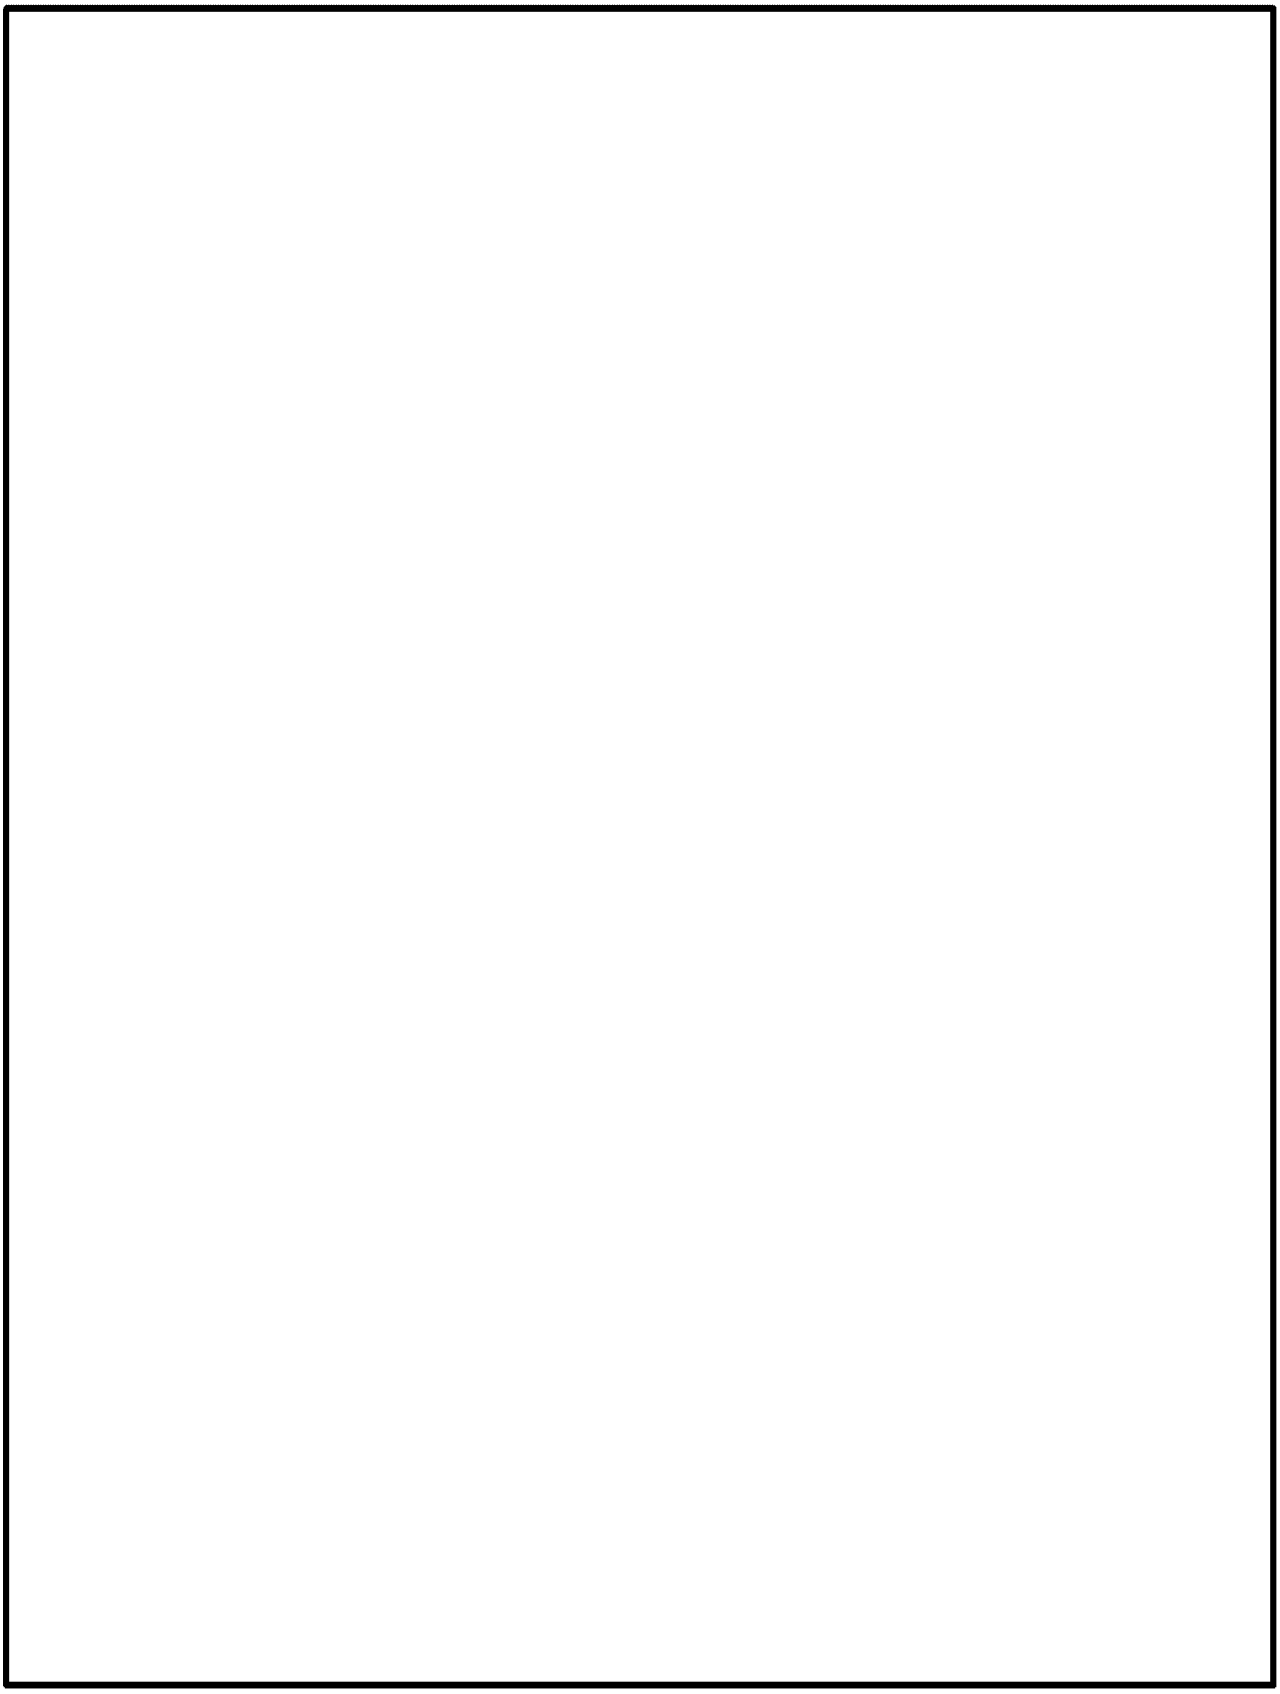
The following residential developments have been identified in the Woodside, NY area similar to Holiday Inn Express & Suites' proposed plan. This section will focus on their strength and weakness compared to the Holiday Inn Express & Suites at Woodside project.





(b)(4)





The Holiday Inn Express & Suites will offer a well-designed, functional layout of support areas and guestrooms and target at the midmarket. All typical and market-appropriate features and amenities appear to be included in the hotel's design. The building will be fully open and operational on the assumed opening date and will meet all local building codes and brand standards. The hotel staff will be adequately trained to allow for a successful opening and that pre-marketing efforts will have introduced the product to major local accounts at least six months in advance of the opening date.

The project principals own Century Construction Group, an established brand in Flushing, New York. It has successfully completed and marketed similar projects such as Marriot Fairfield Inn., Leavitt Manor Condominium, Farrington Estate, all located in Flushing. The project principals plan to expand its existing midmarket to reach more audience through the Holiday Inn Express & Suites project.

The project's revenue goals are:

- Increase top line revenue through daily pricing opportunities
- Maximize Special Event periods with proper LOS (Length of Stay) restrictions
- Increase RevPAR (Revenue Per Available Room) during typically low Occupancy periods
- Maximize GDS(Global Distribution System) bookings by ensuring availability and correct content

The Revenue Director will first consult with the General Manager and the Director of Sales to fully understand the current day-to-day Sales and Revenue Management efforts already in place. The coordinated effort continues through daily communication to solidify the program and get full understanding from all key employees, including Guest Service Agents.

Rates, LOS restrictions and the reduction of unnecessary discounting can be properly adjusted 24 hours a day as booking pace increases pass set thresholds. Potential sell-out nights can be monitored until the last room is sold for right pricing.

The project's marketing channel will focus on E-Distribution:

- All online content will keep the hotel one step ahead of the competition, by expanding and enhancing guest's online options for shopping, decision making, managing and booking

for groups, meetings, corporate and leisure travel. This will create greater efficiency and effectiveness for the hotel and an easy, and seamless online experience for customers.

- Starting on the supply side at the property level, we will forecast on a daily basis to ensure the property-management systems reflects the correct availability, and provide discounts to capture additional occupancy during special need times. The hotel will stay ahead of competition by removing availability and restricting unnecessary price breaks.

The process of distribution begins with four main points to which rate and inventory are sent to:

1. IHG central reservations office;
2. The global distribution system;
3. The hotel's website;
4. An online travel agent (Expedia, Priceline, Kayak, Hotels.com, etc.)

The four booking channels are monitored daily to ensure the project is maximizing revenue through these fast growing contributing channels. A focus of redirection from online travel agents to hotel's website is also driven through Social Media campaigns to further reduce any additional commissions or discounts.

SECTION III: FINANCIAL

VIABILITY OF THE PROJECT; PROJECT FUNDING & CAPITALIZATION EXIT PLAN; INCOME PROJECTIONS & REASONABLE ANALYSIS METHODOLOGY

EXIT PLAN & PROJECT VIABILITY

The loan from QB Ventures EB5 Capital, LLC will be paid off in full either through the residential condominium sales, refinancing of hotel, retails and community facility upon stabilization. The project will not be refinanced or sold prior to the adjudication of the I-829 petitions.

The project principal has extensive experience and is confident that the proceeds from either strategy should be more than sufficient to pay off the EB-5 investors in full. However, in the event the above strategy is insufficient to pay off the loan in full, the borrower shall cover the shortfall from its own operating cash flow, or risk foreclosure and loss of its ownership of the Project to the Partnership. This is not a redemption clause. The EB-5 capital is placed "at risk". The developer will make the best efforts that are economically feasible to repay the EB-5 investors.

USE OF CAPITAL

(b)(4)

The Holiday Inn Express & Suites' total cost is [redacted] which includes land costs estimated at $9 million and development cost estimated at [redacted] consisting of hard construction costs of approximately [redacted] and soft costs of approximately [redacted] For analysis purposes, this equates to a total development budget of $1682/SF for 16,050 SF of gross building area including parking decks. This budget includes hard costs, contingencies, financing, pre-opening and other soft costs, but excludes site acquisition.

The JCE Company intends to raise capital to cover the costs using both conventional financing and through business loans by means of a private placement offering to EB-5 investors. Specifically, the NCE will raise a maximum of [redacted] in EB-5 capital, which will be loaned

(b)(4)

to the JCE. The Company plans to sell EB5 Membership Units, at $500,000 per unit, to qualified foreign investors seeking to obtain permanent residence in the United States through the EB-5 Visa Program. No additional capital contributions are required.

Contingency Plan:
As necessary, the Queens Blvd Ventures, LLC (JCE) may also receive temporary short-term bridge financing or traditional bank financing through lenders in order to commence construction and create jobs in advance of EB-5 funding.

Sales, Cost, Income, and Investment Projections

(b)(4)

It is to be noted that the first year of operations does not reflect anticipated long-term performance of the hotel project. It only reflects the initial operations from the time the hotel first opens with little business, as it builds to full staffing complement, begins to work "the kinks" out of operations, gets marketing efforts underway and allows time for them to get traction, and builds the market image and place for the hotel. Based on operating history and market performance (with inflation adjustment), it is conservatively estimated that stabilization will occur in year 3 by 2017 with an annual occupancy of 86%. The term "stabilization" properly reflects the industry experience over most of the past century that after this initial ramp up, the hotel reaches a stabilized level that will be maintained during its 20 to 30 year economic lifespan.

FINANCIAL PROJECTIONS AND ANALYSIS METHODOLOGY

The financial projection data of the project is provided by an independent appraisal by HVS Group. In order to examine the job creation based on the projections, the following analysis methodologies are considered: (1) reviewing Holiday Inn Express & Suites' projected operational pro forma; (2) estimating the portion of that budget which would represent labor costs; (3) verifying the estimate for reasonableness by against the corresponding direct effects employment creation multipliers.

The Holiday Inn Express & Suites' forecasted market share and occupancy levels are based upon its anticipated competitive position within the market, as quantified by its penetration rate. The penetration rate is the ratio of a property's market share to its fair share.

The projections, demand capture, and occupancy performance for the Holiday Inn Express & Suites for these types of adjustments to market share within the defined competitive market. Consequently, the actual penetration factors applicable to the project and its competitors for each market segment in each projection year may vary from the penetration factors set out by the industry standards.

PROJECT PROFIT FORECAST

(b)(4)

The Project is located at 64-06 Queens Blvd, Woodside, NY 11373 and has an estimated total cost of [redacted] After its total prospective market value upon completion (2018) of [redacted] it is anticipated that the project will result in a profit of [redacted]

Please see below for the breakdown:

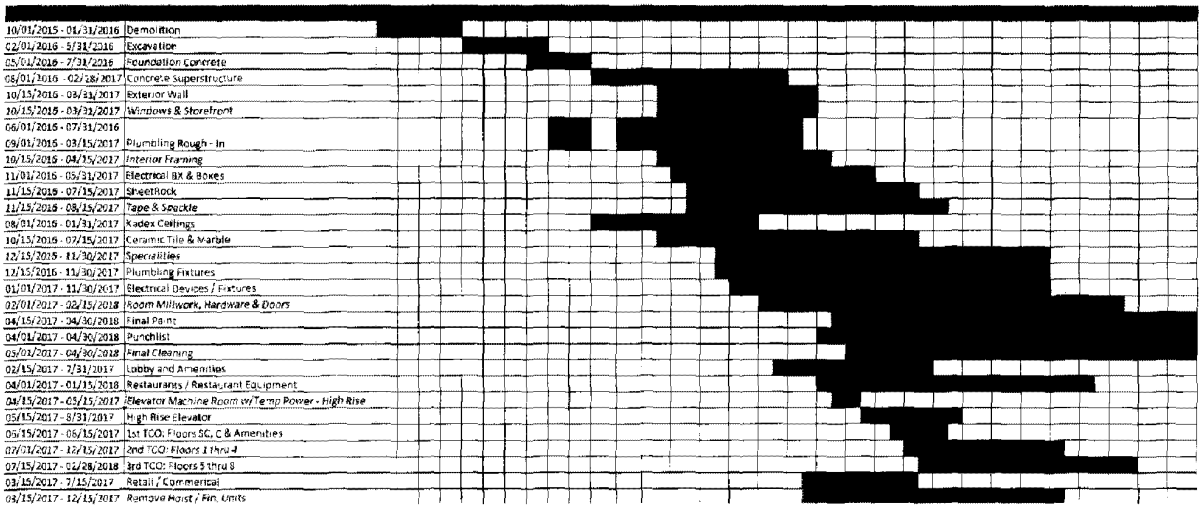
SECTION IV: CONSTRUCTION / PERMITS AND LICENSES

A. PARTICULARS OF THE CONSTRUCTION PHASES

Please refer to the timeline for the construction attached at **Exhibit 10.**
(Snapshot below)

This detailed construction timeline was produced by **Century Construction Group,** the General Contractors for the construction. The General Construction Verification Letter dated September 15, 2015 can be found at **Exhibit 16.**

Snapshot of the Construction Timeline



The construction of the Holiday Inn Express & Suites project will take approximately 27-months to complete. The submitted schedule at **Exhibit 10.** The demolition phase of the project is scheduled to begin in October of 2015.

The developer obtained all necessary permit and licenses in demolition, and is scheduled to obtain the permit and licenses for construction and development of the project. The developer has obtained all necessary permits and licenses to begin construction and development of the project. Construction is expected to take begin in October 2015, and it is anticipated that construction will be completed by mid-2018.

The Holiday Inn Express & Suites' construction costs prepared by ***Century Construction Group*** have been estimated to be [redacted] and the estimated time to complete the construction will be within **27 months**.

(b)(4)

(i) Analysis Method of the Construction Timeline and Costs

The construction timeline is estimated to be 27 months excluding the time to demolish the existing structure. The construction budget for the project is estimated at [redacted] The hotel will include 135 guest rooms, including 2 suites, a breakfast room, a fitness room, business center, market pantry, outdoor lounge, and vending areas. The construction of the Project will take approximately

(b)(4)

27-months to complete. The construction budget was estimated by **Century Construction Group** This was based on their previous experience of projects similar in size and nature and scope. [1]

Century Construction Group has worked in the construction industry for twenty (20) years and has supervised, managed and/or constructed similar projects to Holiday Inn Express & Suites, such as the Marriot Fairfield Inn, Leavitt Manor Condominium, and Whitestone Tower Condominium, which are all located in Flushing.

(ii) Mr. George Xu is an Expert in the Field.

Founded and headed by George Xu, Century Development Group is an integrated Real Estate Development Company. Since the late 1990's, Mr. Xu has been involved in the developments of residential, commercial, mixed-use and hospitality projects primarily in the borough of Queens, New York. To date, George Xu has worked on over a million square feet of real estate developments; mixed-use developments including residential, hospitality, office, and retail. The total value of his completed projects is calculated to be over [redacted] The net worth of his current and developing projects is anticipated to be over [redacted] The total asset of his projects is over [redacted]

(b)(4) (b)(4)

Mr. George Xu is the owner of the The Holiday Inn Express & Suites project and the owner of the proposed Century New York City Regional Center. With over 20 years of real estate holding and development experience, he has worked on over a million of square feet of real estate developments; mixed-use developments including residential, hospitality, office, retail, and in all phases of assembly, acquisition, finance, design, construction, marketing and sales. Mr. Xu's projects have involved close collaboration with the City of New York, as well as the State of New York on issues including zoning, land use, and environmental matters. Mr. Xu provides marketing oversight and policy guidance for the Century New York City Regional Center's operations. Mr. Xu holds a Bachelor of Science degree in Electrical Engineering and a Master of Science degree in Computer Science from Polytechnic University, New York.

Please see the snapshot of the verification letter below.

Re: Holiday Inn Express & Suites
64-06 Queens Blvd, Woodside, NY 11377

Dear CSC EB-5 Unit Officer:

Century Construction Group was hired by Queens Blvd Ventures, LLC as the general contractor on the above-referenced Project. I am the president of Century Construction Group and have worked in the construction industry for twenty years and have supervised, managed and/or constructed. My experience includes hospitality, commercial interior and residential projects. I have constructed similar projects to the proposed Holiday Inn Express & Suites in term of size, budgets and timeline. These projects include the Marriot Fairfield Inn, the Leavitt Manor Condominium and the Farrington Estate, all located in Flushing. I have been asked by Queens Blvd Ventures, LLC to provide you with some information concerning the Project in connection with certain funding obtained by EB-5.

Century Construction Group has advised that hard construction cost estimate would b[redacted] (b)(4) (b)(4) [redacted] The construction timeline is 27 months. This Holiday Inn Express & Suites hotel will include a breakfast room, a fitness room, business center, market pantry, outdoor lounge, and vending areas. This hotel will include 135 rooms and suites. The Demolition is scheduled to begin in early October of 2015. I attest that the construction budgets and timeline are estimated based on established industry standards.

Very Truly Yours,

George Xu
President

35-06 Leavitt St., Suite CF-A Flushing, NY 11354
Tel: (718) 939-1060 Fax: (718) 939-1036
www.centurygroupdevelopment.com

(iii) **Satisfactory Compliance with *Matter of Ho*:**

Mr. George Xu has the appropriate qualifications that validate his position as an expert in the field, he is therefore in a position to be an authority on the construction budget and timeline.

In addition, George Xu's statement satisfactorily complies with the *Matter of Ho* in terms of comparison studies of the business described. On page 9 of the *Matter of Ho*, the submitted documents shall contain *"a comparison of competition's products."* And *"set forth the business' organizational structure and its personnel's experience"*. The letter and professional profile includes Mr. George Xu's previous experience and construction timeline and the attached documentation for Century Construction Group verifies their ability to accurately assess the construction budget based on the comparison studies of similar projects in similar locations.

PERMITS AND LICENSES

In New York City the construction is "as of-right" development which complies with all applicable zoning regulations and does not require any discretionary action (special permit or variance) by the City Planning Commission or Board of Standards and Appeals for approval. Assuming that the project complies with all other Code and Zoning regulations, the NYC Department of Buildings Plan Examiner Plan Examiner will approve the Plans, further to the architect's construction detailed blueprints and renditions.

It is not necessary for the project to seek the additional approvals of the City Planning Commission, or of the Local Community Board, or of any other outside party of interest. If the project complies with the applicable Zoning Laws currently in force, the developer is entitled to build. Therefore building permits are only valid for a limited amount of time and the project will apply for the relevant permits prior to the commencement of the construction activities. The Project obtained New Building Permit in July 2015.

The Project has already received/will receive the following permits:

Work Permits Schedule for Holiday Inn

SECTION V: EMPLOYMENT AND JOB CREATION

(b)(4)

Based on the EB-5 Economic Impact Studies conducted by Evans, Carroll & Associates, Inc., the 135-room Holiday Inn Express and Suites will create [redacted] jobs, including [redacted] jobs from direct and indirect from construction employment, and [redacted] jobs from direct and indirect employees. The project intends to raise [redacted] from [redacted] EB-5 investors.

(b)(4)

The economic impact of the project was assessed and tabulated by Michael K. Evans of Evans, Carroll & Associates, Inc. Dr. Evans, Chairman of the company since 1980, is a specialist in EB-5 immigration analysis and economic impact studies of development projects and new construction. Dr. Evans holds a Ph.D. in Economics from Brown University and was an Assistant and Associate Professor of Economics at Wharton School, University of Pennsylvania. He was also Chief Economist at American Economics Group from 2000-2008. Please see Dr. Evans resume attached at **Exhibit 6**.

5.1 THE RIMS II INPUT/OUTPUT MODEL

Economic and job creation impact modeling to determine the likely economic and job creation impacts associated with the EB-5 project was performed using the RIMS II Input/Output model. RIMS II is widely used in both the public and private sector. In the public sector, for example, the Department of Defense uses RIMS II to estimate the regional impacts of military base closings. State transportation departments use RIMS II to estimate the regional impacts of airport construction and expansion. In the private-sector, analysts and consultants use RIMS II to estimate the regional impacts of a variety of projects, such as the development of shopping malls and sports stadiums.

5.2 DIRECT AND INDIRECT JOBS

Table A below presents the job creation associated with the Holiday Inn Express & Suites EB-5 Project . Table A shows the annual revenue, the final demand multiplier, and the total number of jobs created by the construction, hotel operations, and rental income of the building. Since the construction will take more than 24 months, the economic impact figures for the hard construction costs and appropriate soft costs include direct as well as indirect and induced jobs. All figures are permanent jobs. The number of jobs created as a result of the Holiday Inn Express & Suites EB-5 Project was determined using the RIMS II model.

Table A. Summary of Employment and Revenue Estimates					
Activity	Exp/Rev mil cur $	Exp/Rev mil 2010 $	RIMS II Mult	Total Jobs	Direct Jobs
Hard construction costs			13.2149		
Architect & Engineering Svcs			11.9014		
Purchase of FF&E *			5.6974		
Hotel Operations			15.0799		
Total					
All figures based on unrounded numbers					
* Indirect and induced jobs only					

5.3 JOBS REQUESTED BY THE EB-5 PROJECT

A. Jobs Arising from Construction Activities

In the case of the Holiday Inn Express & Suites EB-5 Project , construction activity lasts for more than two years. Since the construction period will take more than 24 months, direct as well as indirect and induced jobs may be included in the EB-5 job count for hard construction costs (although not for FF&E) for each NAICS activity associated with the project's construction activities.

Table 8-3 below shows there will be a total of [ ] jobs would be created from the hard construction costs of the building. Output would rise about [ ] while household earnings would increase by about [ ] Table 8-4 shows the average output per new worker is about [ ] while average earnings are about [ ]

B.

C. Jobs Arising from Hotel Operations and Rental Income

Through application of the EB-5 Program criteria described above to the total jobs created by the Holiday Inn Express & Suites EB-5 Project 's hotel operations and rental income, the analyst concluded that the direct and indirect jobs created within the geographic boundaries of the regional center may be considered attributable to the regional center entity.

Table 9-3 below shows there will be a total of [redacted] jobs created from the hotel operations, of which [redacted] would be direct jobs.

Superior results through unrivaled hospitality intelligence. Everywhere.

Dear Mr. Xu: (b)(4)

Pursuant to your request, we herewith submit our narrative appraisal report pertaining to the above-captioned proposed hotel. We have inspected the real estate and analyzed the market conditions in the Queens, New York area. We have also reviewed the proposed improvements for this site. Our report has been prepared in accordance with, and is subject to, the requirements of the Financial Institutions Reform, Recovery, and Enforcement Act (FIRREA) and the Uniform Standards of Professional Appraisal Practice (USPAP), as provided by the Appraisal Foundation.

Based on our analysis, it is our opinion that the "as is" market value of the fee simple interest in the Proposed Holiday Inn Express & Suites Woodside, as of August 3, 2015, is [redacted]

Based on our analysis, it is our opinion that the "when complete" market value of the fee simple interest in the real and personal property of the Proposed Holiday Inn Express & Suites Woodside, as of March 1, 2018, will be:

[redacted]

This value estimate equates to [redacted] per room. We have also estimated the prospective market value of the subject property as of its projected date of stabilization. Based on our analysis, it is our opinion that the "when stabilized" prospective market value of the fee simple interest in the real and personal property of the Proposed Holiday Inn Express & Suites Woodside, as of March 1, 2020, will be:

[redacted]

This value opinion equates to [redacted] per room.

We have made no assumptions of hypothetical conditions in our report. The analysis is based on the extraordinary assumption that the described improvements have been completed as of the prospective "when complete" date of value. The reader should understand that the completed subject property does not yet exist as of the date of appraisal. Our appraisal does not address unforeseeable events that could alter the proposed project and/or the market conditions reflected in the analyses; we assume that no significant changes, other than those anticipated and explained in this report, shall take place between the date of inspection and date of prospective value. Furthermore, the subject property is located in a designated "Special Area" for tax purpose; our projection is predicated upon the extraordinary assumption that the subject hotel will receive the ICAP tax abatement for a 25-year period. The use of these extraordinary assumptions may have affected the assignment results. We have made no other extraordinary assumptions specific to this appraisal. However, several important general assumptions have been made that apply to this appraisal and our valuations of proposed hotels in general. These aspects are set forth in the Assumptions and Limiting Conditions chapter of this report.

We hereby certify that we have no undisclosed interest in the property, and our employment and compensation are not contingent upon our findings. This study is subject to the comments made throughout this report and to all assumptions and limiting conditions set forth herein.

Sincerely,
TS Worldwide, LLC

ASSIGNMENT CONDITIONS

Extraordinary Assumptions:

Hypothetical Conditions:

2. Nature of the Assignment

Subject of the Appraisal

The subject of the appraisal is the fee simple interest in a 16,050-square-foot (0.37-acre) site to be improved with a limited-service lodging facility; the hotel will be associated with the Holiday Inn Express brand. The property, which is expected to open on March 1, 2018, will feature 135 rooms including 2 suites, a breakfast room, a fitness room, business center, market pantry, outdoor lounge, and vending areas. The hotel will also contain all necessary back-of-the-house space.

The subject site's location is 64-06 Queens Boulevard, Queens, New York, 11377. The subject site currently contains a one-story retail structure which will be demolished to allow for the construction of the subject hotel.

Property Rights Appraised

The property rights appraised are the fee simple ownership of the land and improvements, including the furniture, fixtures, and equipment. The fee simple estate is defined as "absolute ownership unencumbered by any other interest or estate, subject only to the limitations imposed by the governmental powers of taxation, eminent domain, police power, and escheat."[1]

The Proposed Holiday Inn Express & Suites Woodside is appraised as an open and operating facility.

Pertinent Dates

The effective date of the "when complete" prospective market value opinion is March 1, 2018. The effective date of the "when stabilized" prospective market value conclusion is March 1, 2020. All projections are expressed in inflated dollars. The subject property was inspected by Chu Y. Xu and Roland deMilleret, MAI on August 3, 2015. The "as is" date of value is August 3, 2015.

Ownership, Franchise, and Management Assumptions

The developer of the proposed subject hotel is Queens Blvd Ventures, LLC, a subsidiary of Century Development Group. The ownership group entered into an agreement to purchase the subject site on March 4, 2014 for a reported sum of $6,000,000. According to public records, the sale was closed in February of 2015. No other transfers of the property have reportedly occurred in the past three years. The site is neither listed nor under contract for sale; furthermore, we have no knowledge of any recent listings.

---

[1] Appraisal Institute, The Dictionary of Real Estate Appraisal, 5th ed. (Chicago: Appraisal Institute, 2010).

We assume that the proposed hotel will be managed by a professional management company that is experienced in the operation of limited-service hotels in this region. The management team had not been selected as of the date of this study. We have assumed a market-appropriate total management fee of 3.0% of total revenues in our study. Please refer to the Income Capitalization Approach chapter for additional discussion pertaining to our management fee assumptions.

The proposed subject hotel will reportedly operate under a franchise agreement with Holiday Hospitality Franchising, LLC as a Holiday Inn Express & Suites; the agreement is expected to span 20 years. Based on our review of the agreement's terms or expected terms, the Holiday Inn Express franchise is reflected in our forecasts with a royalty fee of 6% of rooms revenue, and a marketing assessment of 3% of rooms revenue. Reservations fees will also be due, and are included in the rooms expense line item of our forecast.

Objective of the Appraisal

The objective of the appraisal is to develop an opinion of the subject property's "as is" market value, "when complete" prospective market value, and "when stabilized" prospective market value. The following definition of market value has been agreed upon by the agencies that regulate federal financial institutions in the United States:

> The most probable price which a property should bring in a competitive and open market under all conditions requisite to a fair sale, the buyer and seller each acting prudently and knowledgeably, and assuming the price is not affected by undue stimulus. Implicit in this definition are the consummation of a sale as of a specified date and the passing of title from seller to buyer under conditions whereby:
>
> 1. buyer and seller are typically motivated;
> 2. both parties are well informed or well advised, and acting in what they consider their own best interests;
> 3. a reasonable time is allowed for exposure in the open market;
> 4. payment is made in terms of cash in U.S. dollars or in terms of financial arrangements comparable thereto; and
> 5. the price represents the normal consideration for the property sold unaffected by special or creative financing or sales concessions granted by anyone associated with the sale.[2]

[illegible]

"As is" market value is defined by the Appraisal Institute as follows:

> The estimate of the market value of real property in its current physical condition, use, and zoning as of the appraisal date.[3]

Prospective market value is defined by the Appraisal Institute as follows:

> A value opinion effective as of a specified future date.[4]

The prospective value opinion upon stabilization estimates the market value of a property upon reaching a stabilized level of operation. Operations are stabilized at that point in time when abnormalities in supply and demand or any additional transitory conditions cease to exist and the existing conditions are those expected to continue over the economic life of the property.

Intended Use of the Appraisal

This narrative appraisal report is being prepared for use in the construction financing of the subject property.

Identification of the Client and Intended User(s)

The client for this engagement is Queens Blvd Ventures LLC. This report is intended for the addressee firm, and may not be distributed to or relied upon by other persons or entities.

Assignment Conditions

"Extraordinary Assumption" is defined in USPAP as follows:

> An assumption, directly related to a specific assignment, as of the effective date of the assignment results, which, if found to be false, could alter the appraiser's opinions or conclusions. Comment: Extraordinary assumptions presume as fact otherwise uncertain information about physical, legal, or economic characteristics of the subject property; or about conditions external to the property, such as market conditions or trends; or about the integrity of data used in an analysis.[5]

The analysis is based on the extraordinary assumption that the described improvements have been completed as of the prospective "when complete" date of value. The reader should understand that the completed subject property does not yet exist as of the date of appraisal. Our appraisal does not address unforeseeable

---

[3] Appraisal Institute, The Dictionary of Real Estate Appraisal, 5th ed. (Chicago: Appraisal Institute, 2010)

[4] Appraisal Institute, The Dictionary of Real Estate Appraisal, 5th ed. (Chicago: Appraisal Institute, 2010)

[5] Appraisal Foundation, Uniform Standards of Professional Appraisal Practice, 2014 - 2015 ed.

events that could alter the proposed project and/or the market conditions reflected in the analyses; we assume that no significant changes, other than those anticipated and explained in this report, shall take place between the date of inspection and date of prospective value. Furthermore, the subject property is located in a designated "Special Area" for tax purpose; our projection is predicated upon the extraordinary assumption that the subject hotel will receive the ICAP tax abatement for a 25-year period. The use of these extraordinary assumptions may have affected the assignment results. We have made no other extraordinary assumptions specific to this appraisal. However, several important general assumptions have been made that apply to this appraisal and our valuations of proposed hotels in general. These aspects are set forth in the Assumptions and Limiting Conditions chapter of this report.

"Hypothetical Condition" is defined in USPAP as follows:

> A condition, directly related to a specific assignment, which is contrary to what is known by the appraiser to exist on the effective date of the assignment results, but is used for the purpose of analysis. Comment: Hypothetical conditions are contrary to known facts about physical, legal, or economic characteristics of the subject property; or about conditions external to the property, such as market conditions or trends; or about the integrity of data used in an analysis.[6]

We have made no assumptions of hypothetical conditions in our report.

We have not made any jurisdictional exceptions to the Uniform Standards of Professional Appraisal Practice in our analysis or report.

Marketing and Exposure Periods

The concepts of marketing period and exposure period are similar and simply reflect different perspectives in time. Exposure period is defined as the estimated length of time that the property interest being appraised would have been offered on the market prior to the hypothetical consummation of a sale at its market value, as of the date of value. The exposure period reflects a retrospective opinion based on an analysis of past events and assumes a competitive and open market. Marketing period refers to the amount of time necessary to market the hotel subsequent to our date of value for it to sell for the appraised value, and thus is a prospective opinion.

[6] Appraisal Foundation, Uniform Standards of Professional Appraisal Practice, 2014 - 2015 ed.

Our opinion is that the exposure period for the subject property, prior to our date of value, is estimated to be less than or equal to seven months, while the marketing period for the subject property, subsequent to our date of value, is less than or equal to seven months. The marketing and sales process for hotels is extremely efficient. Brokers specializing in hotel transactions actively solicit potential buyers on an ongoing basis and maintain databases on hotel investor criteria. According to the brokers interviewed, the current period from when a property is listed to when the sale closes is typically six to nine months. Brokers are able to electronically produce marketing materials, elicit interest, schedule property tours, accept offers, and select a buyer in approximately 90 to 120 days. Following the execution of a purchase and sale agreement, the due diligence and closing period is typically 90 days.

Hotel properties are being actively sought after by investors. Quality assets often solicit numerous bids, financing is readily available, and for qualified buyers and sellers, the marketing process has resulted in the timely closing of transactions.

Published surveys report marketing time, not the exposure period. Marketing time is an opinion of the amount of time it might take to sell a property at the concluded market value level during the period immediately after the effective date of an appraisal. Currently, marketing time for luxury/upper-upscale properties, full-service hotels, and select-service hotels is averaging 6.3, 6.6, and 6.6 months, respectively, according to the PWC Real Estate Investor Survey - First Quarter 2015, published by PricewaterhouseCoopers. Overall marketing time is averaging 5.3 months for hotels, as reported by the Situs Real Estate Research Corporation's Winter 2015 Real Estate Survey. The following table illustrates marketing periods reported in recent PWC Real Estate Investor Surveys.

FIGURE 2-1 MARKETING PERIODS (MONTHS)

Property Type	1st Quarter '15	3rd Quarter '14	Year Ago
Luxury/Upper-Upscale	3.0 to 12.0	3.0 to 12.0	3.0 to 20.0
Average	*6.3*	*6.0*	*7.8*
Full-Service	3.0 to 9.0	3.0 to 9.0	3.0 to 12.0

Competency

Our qualifications are included as an addendum to this report. These qualifications reflect that we have the competence required to complete this engagement, in accordance with the competency provision of the Uniform Standards of Professional Appraisal Practice. Our knowledge and experience is appropriate for the complexity of this assignment.

Scope of Work

The methodology used to develop this appraisal is based on the market research and valuation techniques set forth in the textbooks authored by Hospitality Valuation Services for the American Institute of Real Estate Appraisers and the Appraisal Institute, entitled *The Valuation of Hotels and Motels,*[7] *Hotels, Motels and Restaurants: Valuations and Market Studies,*[8] *The Computerized Income Approach to Hotel/Motel Market Studies and Valuations,*[9] *Hotels and Motels: A Guide to Market Analysis, Investment Analysis, and Valuations,*[10] and *Hotels and Motels – Valuations and Market Studies.*[11]

1. All information was collected and analyzed by the staff of TS Worldwide, LLC. Information was supplied by the client and/or the property's development team.
2. The subject site has been evaluated from the viewpoint of its physical utility for the future operation of a hotel, as well as access, visibility, and other relevant factors.
3. The subject property's proposed improvements have been reviewed for their expected quality of construction, design, and layout efficiency.
4. The surrounding economic environment, on both an area and neighborhood level, has been reviewed to identify specific hostelry-related economic and demographic trends that may have an impact on future demand for hotels.
5. Dividing the market for hotel accommodations into individual segments defines specific market characteristics for the types of travelers expected to utilize the area's hotels. The factors investigated include purpose of visit,

average length of stay, facilities and amenities required, seasonality, daily demand fluctuations, and price sensitivity.

6. An analysis of existing and proposed competition provides an indication of the current accommodated demand, along with market penetration and the degree of competitiveness. Unless noted otherwise, we have inspected the competitive lodging facilities summarized in this report.

7. Documentation for an occupancy and average rate projection is derived utilizing the build-up approach based on an analysis of lodging activity.

8. A detailed projection of income and expense made in accordance with the Uniform System of Accounts for the Lodging Industry sets forth the anticipated economic benefits of the subject property.

9. The appraisal considers the following three approaches to value: cost, sales comparison, and income capitalization. We have investigated numerous improved sales in the market area and have spoken with buyers, sellers, brokers, property developers, and public officials. Because lodging facilities are income-producing properties that are normally bought and sold on the basis of capitalization of their anticipated stabilized earning power, the greatest weight is given to the value indicated by the income capitalization approach. We find that most hotel investors employ a similar procedure in formulating their purchase decisions, and thus the income capitalization approach most closely reflects the rationale of typical buyers.

The value conclusion of the appraisal is based on this investigation and analysis and is conveyed in this narrative report. The analyses, opinions, and conclusions were developed based on, and this report has been prepared in conformance with, our interpretation of the guidelines and recommendations set forth in USPAP.

3. Description of the Site and Neighborhood

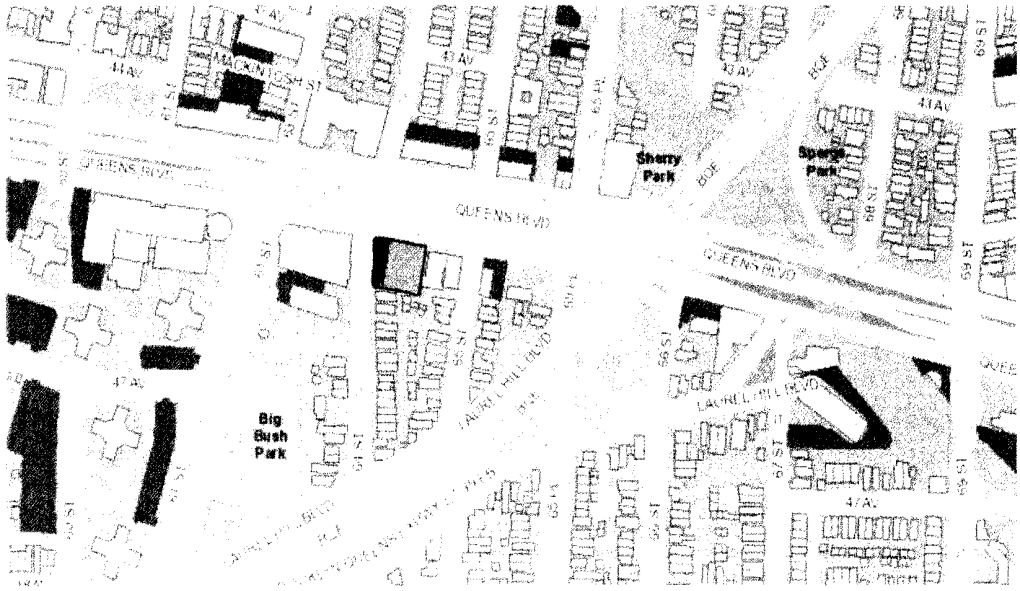
The suitability of the land for the operation of a lodging facility is an important consideration affecting the economic viability of a property and its overall value. Factors such as size, topography, access, visibility, and the availability of utilities have a direct impact on the desirability of a particular site.

The subject site is located in the southwest quadrant of the intersection formed by Interstate 278 (Brooklyn-Queens Expressway) and Queens Boulevard, in the neighborhood of Woodside. Municipal jurisdictions governing the property include the Borough of Queens and the City and State of New York. The street address of the Proposed Holiday Inn Express & Suites Woodside is 64-06 Queens Boulevard, Queens, New York, 11377.

Physical Characteristics

The subject site measures approximately 0.37 acres, or ±16,050 square feet. Primary vehicular access to the property is provided by Queens Boulevard. Access will also be available from 64th Street. The topography of the parcel is generally flat, and the site's shape is generally square.

VIEW OF SUBJECT SITE



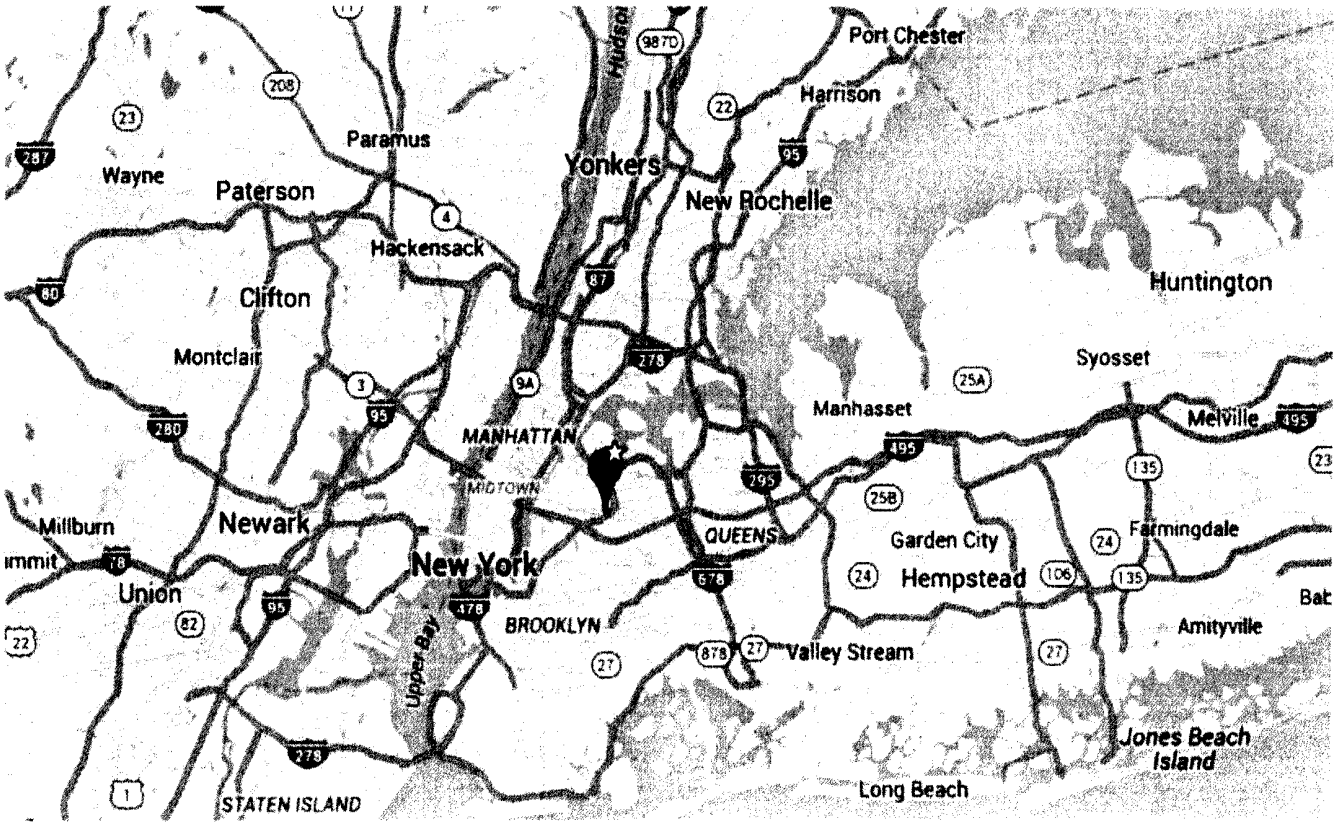
Site Utility

Upon completion of construction, the subject site will not contain any significant portion of undeveloped land that could be sold, entitled, and developed for alternate use. It is expected that the site will be developed fully with building and site improvements, thus contributing to the overall profitability of the hotel.

Access and Visibility

It is important to analyze the site in regard to ease of access with respect to regional and local transportation routes and demand generators. The subject site is readily accessible to a variety of local and county roads, as well as state and interstate highways.

MAP OF REGIONAL ACCESS ROUTES



The subject site is located proximate to Brooklyn Queens Expressway (BQE - Interstate 278), which connects the subject site to various parts of Brooklyn, Queens, and Bronx, and provides accesses to other major thoroughfares such as Long Island Expressway (LIE) and Grand Central Parkway. From the subject site, access to Manhattan, the commercial center of New York City, may be easily accomplished via the westbound Queens Boulevard and crossing the Queensboro

Bridge (also known as the 59th Street Bridge). Alternatively, motorists may access Manhattan via the LIE and the Midtown Tunnel.

The subject site is also served by other accessible transportation offerings, including the Long Island Rail Road and New York City's extensive subway system. We note that the subject site is located within short distance of the Long Island Rail Road Woodside Station. The closest subway station is located approximately one half mile north of the subject site, providing access to the 7 Train, which runs between Times Square, Manhattan and Main Street, Flushing. Overall, access to the subject site is considered to be adequate.

The subject site is located on Queens Boulevard, a 12-lane thoroughfare. Given its frontage along Queens Boulevard and anticipated exterior signage, visibility of the proposed subject property is expected to be good.

Airport Access

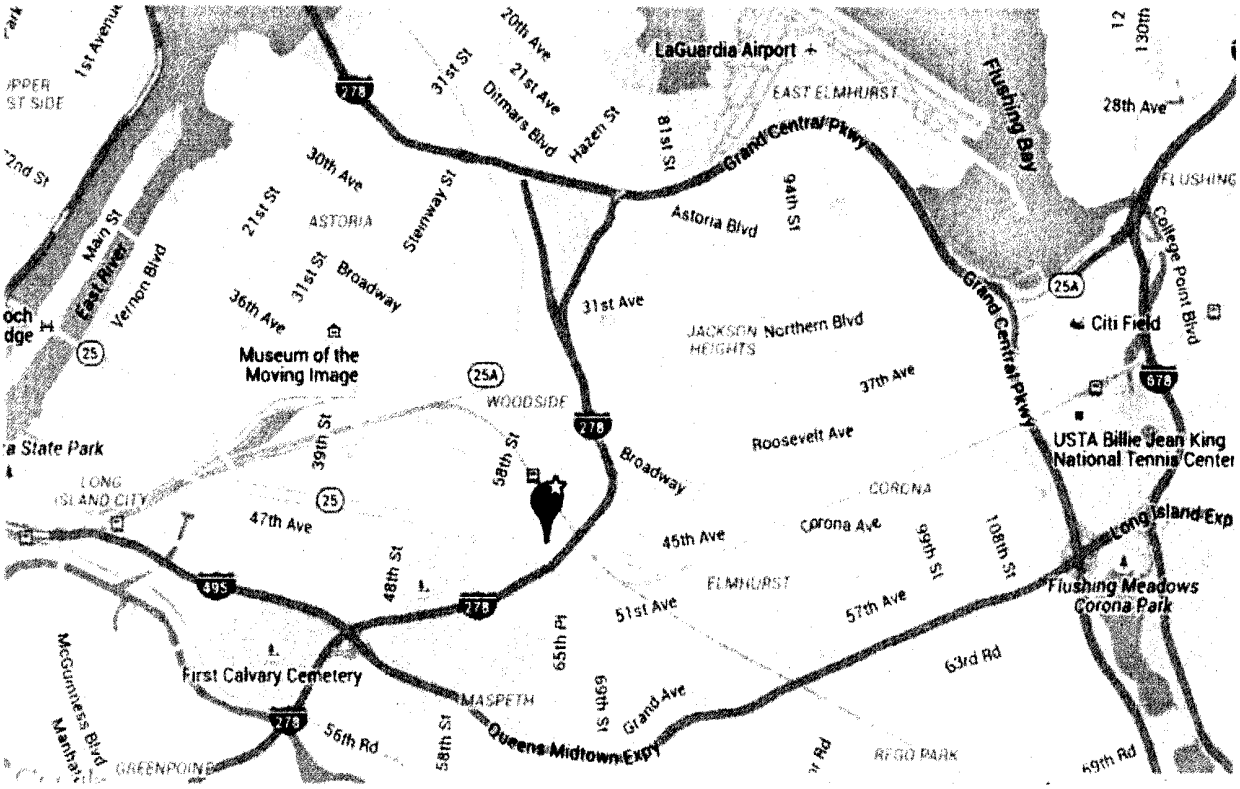
Guests staying at the subject property will benefit from its proximity to the New York City airports. LaGuardia Airport is roughly four miles north of the subject site, and may be reached by traveling north on the Brooklyn- Queens Expressway, which is situated east of the subject site, to Grand Central Parkway eastbound. Travel time to LaGuardia averages ten to 15 minutes, depending upon traffic conditions. In addition, John F. Kennedy International Airport is situated approximately 14 miles southeast of the subject property, and can be reached in roughly 20 minutes under normal traffic conditions. Access to this airport from the subject site is available via Interstate 495 and the Van Wyck Expressway.

Neighborhood

The neighborhood surrounding a lodging facility often has an impact on a hotel's status, image, class, style of operation, and sometimes its ability to attract and properly serve a particular market segment. This section of the report investigates the subject neighborhood and evaluates any pertinent location factors that could affect its future occupancy, average rate, and overall profitability.

Woodside is primarily residential neighborhood in the western portion of the New York City borough of Queens. It is bordered on the south by Maspeth, on the north by Astoria, on the west by Sunnyside and on the east by Elmhurst and Jackson Heights. The area surrounding the subject site is characterized by mid-rise apartment buildings, neighborhood businesses, and community facilities. Overall, the supportive nature of the development in the immediate area is considered appropriate for and conducive to the operation of a hotel.

MAP OF NEIGHBORHOOD



Utilities

The subject site will reportedly be served by all necessary utilities.

Soil and Subsoil Conditions

Geological and soil reports were not provided to us or made available for our review during the preparation of this report. We are not qualified to evaluate soil conditions other than by a visual inspection of the surface; no extraordinary conditions were apparent.

Nuisances and Hazards

We were not informed of any site-specific nuisances or hazards, and there were no visible signs of toxic ground contaminants at the time of our inspection. Because we are not experts in this field, we do not warrant the absence of hazardous waste and urge the reader to obtain an independent analysis of these factors.

Zoning

According to the local planning office, the subject property is zoned as follows: ***C2-3/R7X, R4-1 - Commercial with Residential Overlay.*** Pursuant to zoning requirements, the proposed subject hotel will feature 93 transient hotel rooms and 42 apartment hotel units, or apartment-style one-bedroom suites. Based on this information and our review of this zoning code, the subject property's proposed use should conform to local zoning regulations. However, we do not warrant the

subject property's conformance with local zoning regulations and recommend an independent verification. We assume that all necessary permits and approvals will be secured (including an appropriate liquor license if applicable), and that the subject property will be constructed in accordance with local zoning ordinances, building codes, and all other applicable regulations. Our zoning analysis should be verified before any physical changes are made to the site.

Easements and Encroachments

We are not aware of any easements attached to the property that would significantly affect the utility of the site or marketability of this project.

Conclusion

We have analyzed the issues of size, topography, access, visibility, and the availability of utilities. In general, the site should be well suited for future hotel use, with acceptable access, visibility, and topography for an effective operation.

4. Description of the Proposed Improvements

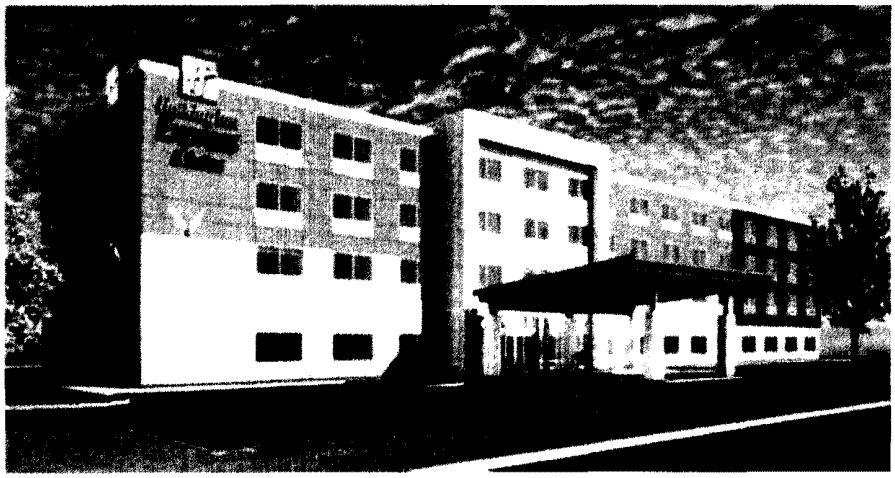
The quality of a lodging facility's physical improvements has a direct influence on marketability, attainable occupancy, and average room rate. The design and functionality of the structure can also affect operating efficiency and overall profitability. This section investigates the subject property's proposed physical improvements and personal property in an effort to determine how they are expected to contribute to attainable cash flows.

Project Overview

The Proposed Holiday Inn Express & Suites Woodside will be a limited-service lodging facility containing 135 rentable units. The eight-story property will open on March 1, 2018.

Holiday Inn Express (and Holiday Inn Express Hotel & Suites) is an upper-midscale, limited-service hotel brand by InterContinental Hotels Group (IHG). According to IHG, Holiday Inn Express is one of the fastest growing hotel brands in its segment. Holiday Inn Express offers competitive rates for both business and leisure travelers. All locations provide the complimentary "Express Start" breakfast bar, and many locations offer recreational amenities such as a swimming pool and/or fitness room. As of year-end 2014, there were 2,060 properties spanning 182,601 rooms in the Americas. In 2014, Holiday Inn Express hotels operated at an average occupancy rate of 68.5%, with an average daily rate of $108.48 and an average RevPAR of $74.26 in the Americas.

TYPICAL HOLIDAY INN EXPRESS EXTERIOR



Summary of the Facilities

Based on information provided by the subject property's development representatives, the following table summarizes the facilities that will be available at the proposed subject hotel.

FIGURE 4-1 PROPOSED FACILITIES SUMMARY

Guestroom Configuration	Number of Units
King	53
Accessible King	3
Queen/Queen	33
Accessible Queen/Queen	4
One-Bedroom Suite - King	16
One-Bedroom Suite - Queen/Queen	26
Total	135

Amenities & Services	
Complimentary Breakfast	Market Pantry
Fitness Center	Vending Areas
Outdoor Lounge	

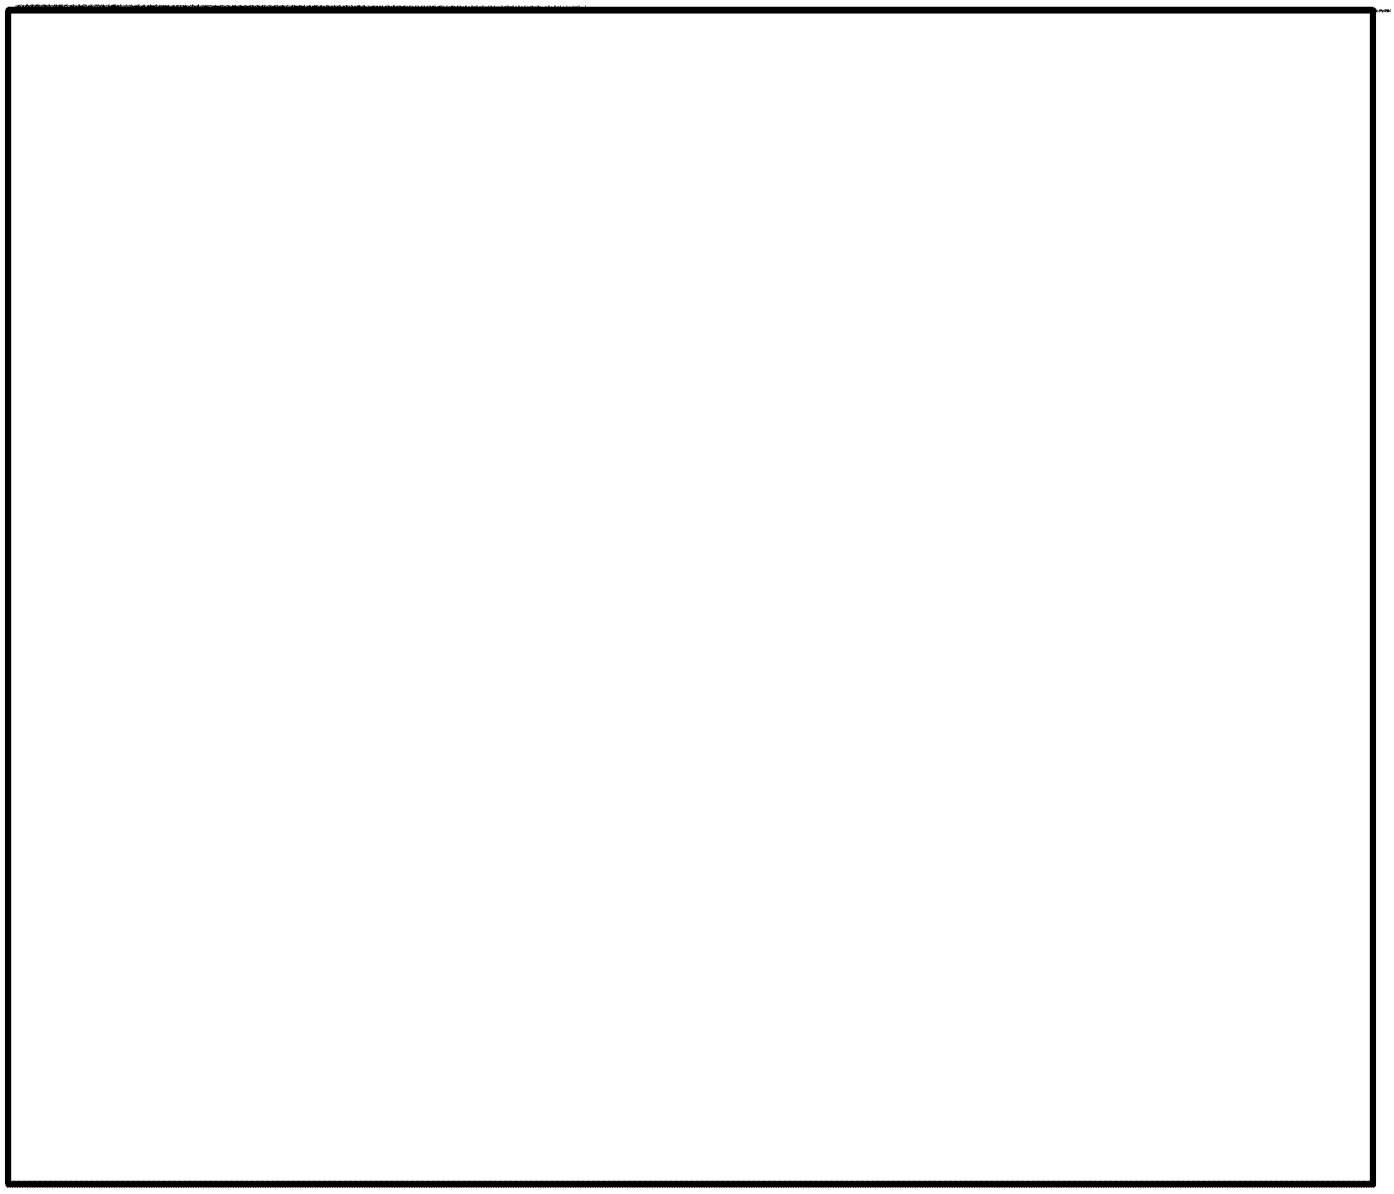
Site Improvements and Hotel Structure

The proposed subject hotel will comprise eight above-grade floors and two cellar floors. Given the sloping elevation of the site, portion of the cellar floor is also at grade. The parking and mechanical spaces will be located on the sub-cellar floor. The cellar floor will house the fitness center, 13 guestrooms, and back-of-the house space. Guests will also be able to access an outdoor lounge from this level. The hotel lobby and breakfast dining area will be located on the ground floor of the building, along with 16 guestrooms. The remaining standard guestrooms will be located on the second and third floors. Guestrooms on fourth floor and above will be configured as apartment-style, one bed-room suites.

The following diagrams further illustrate the layout of the proposed subject property.

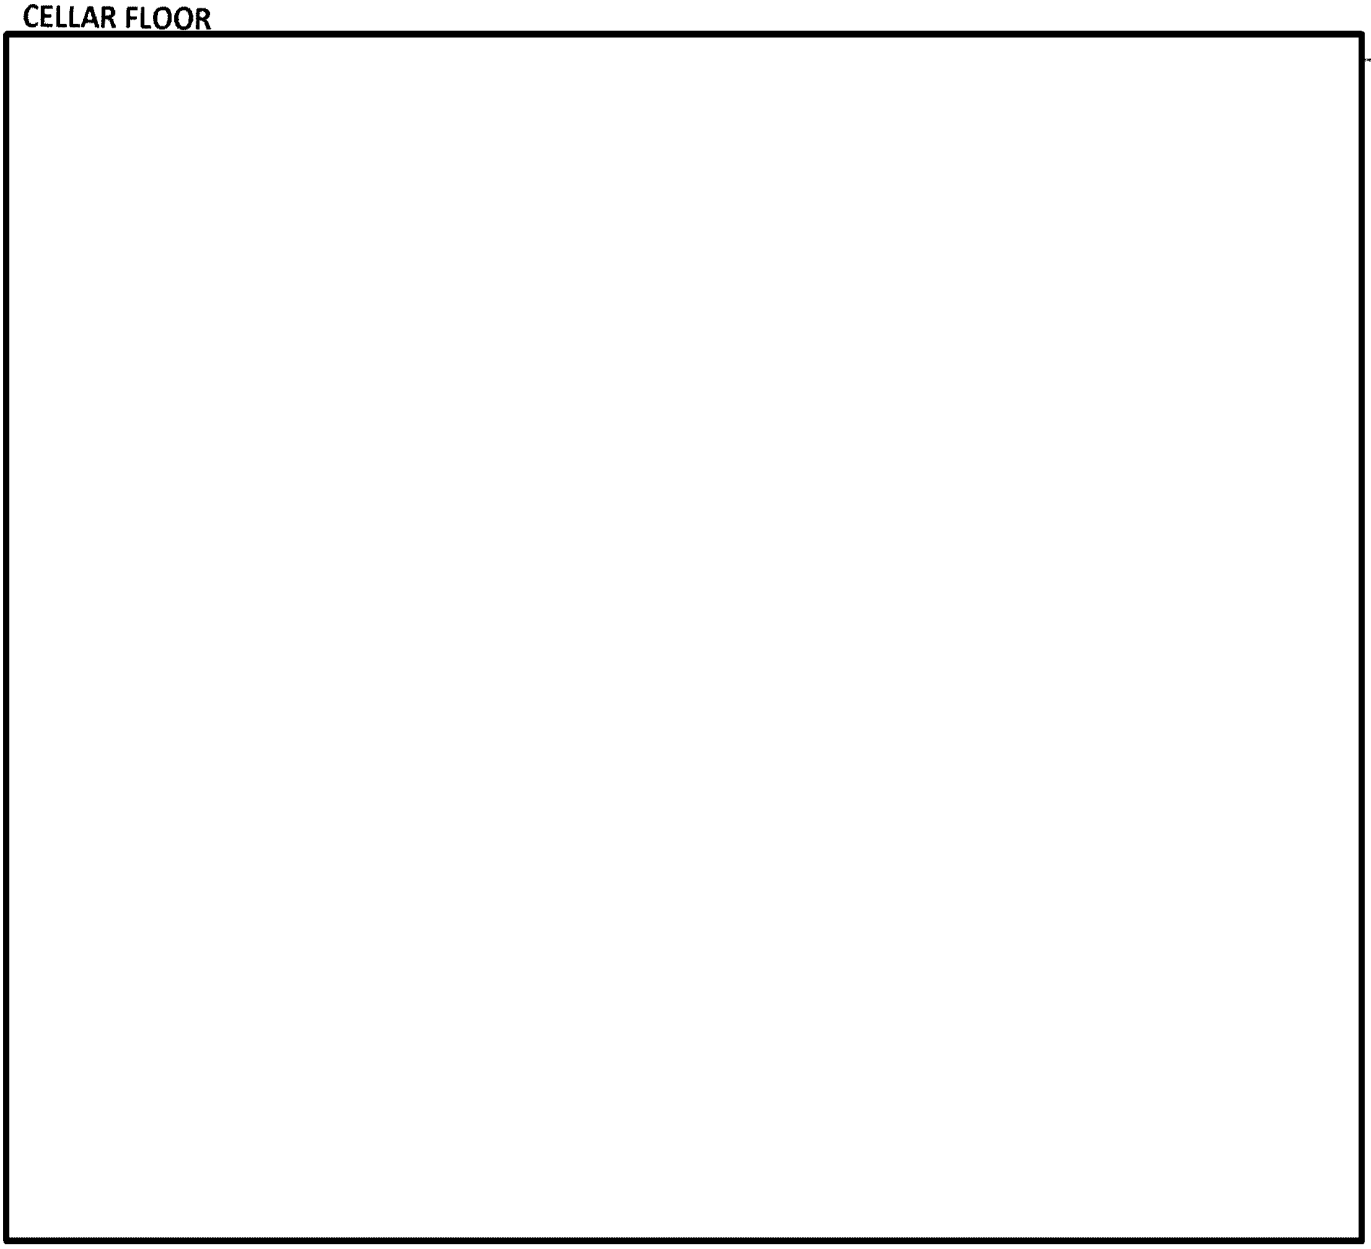
(b)(4)

SUBCELLAR FLOOR



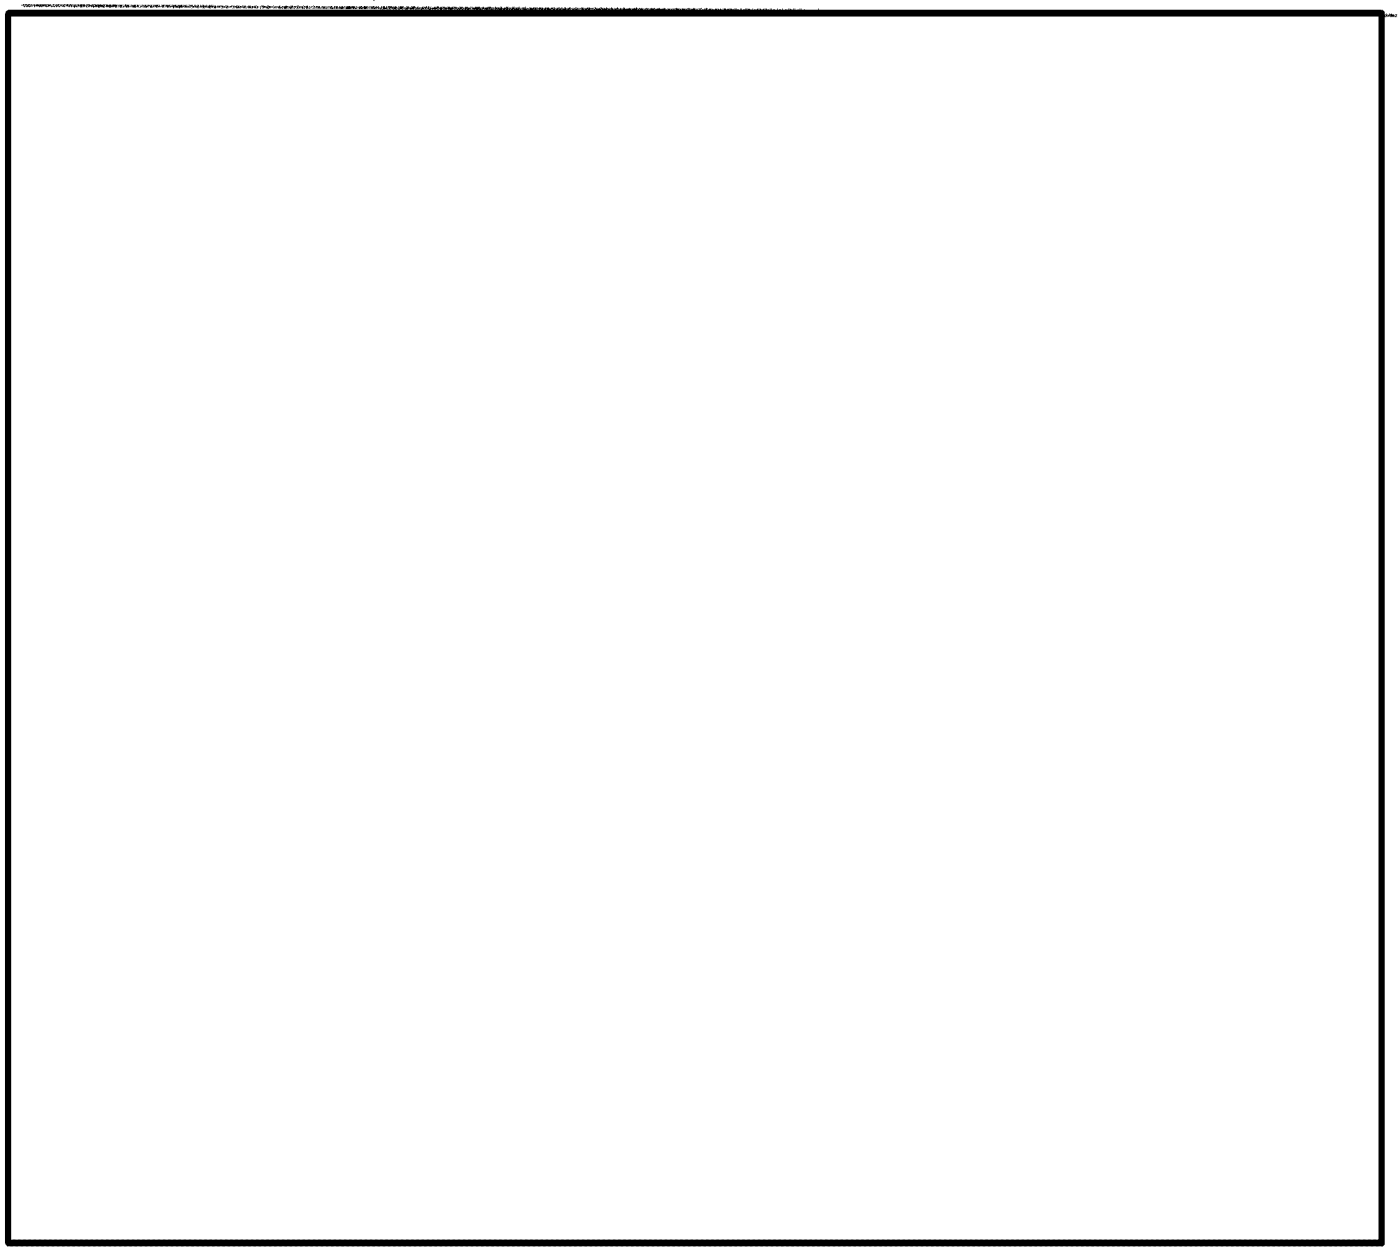
(b)(4)

CELLAR FLOOR



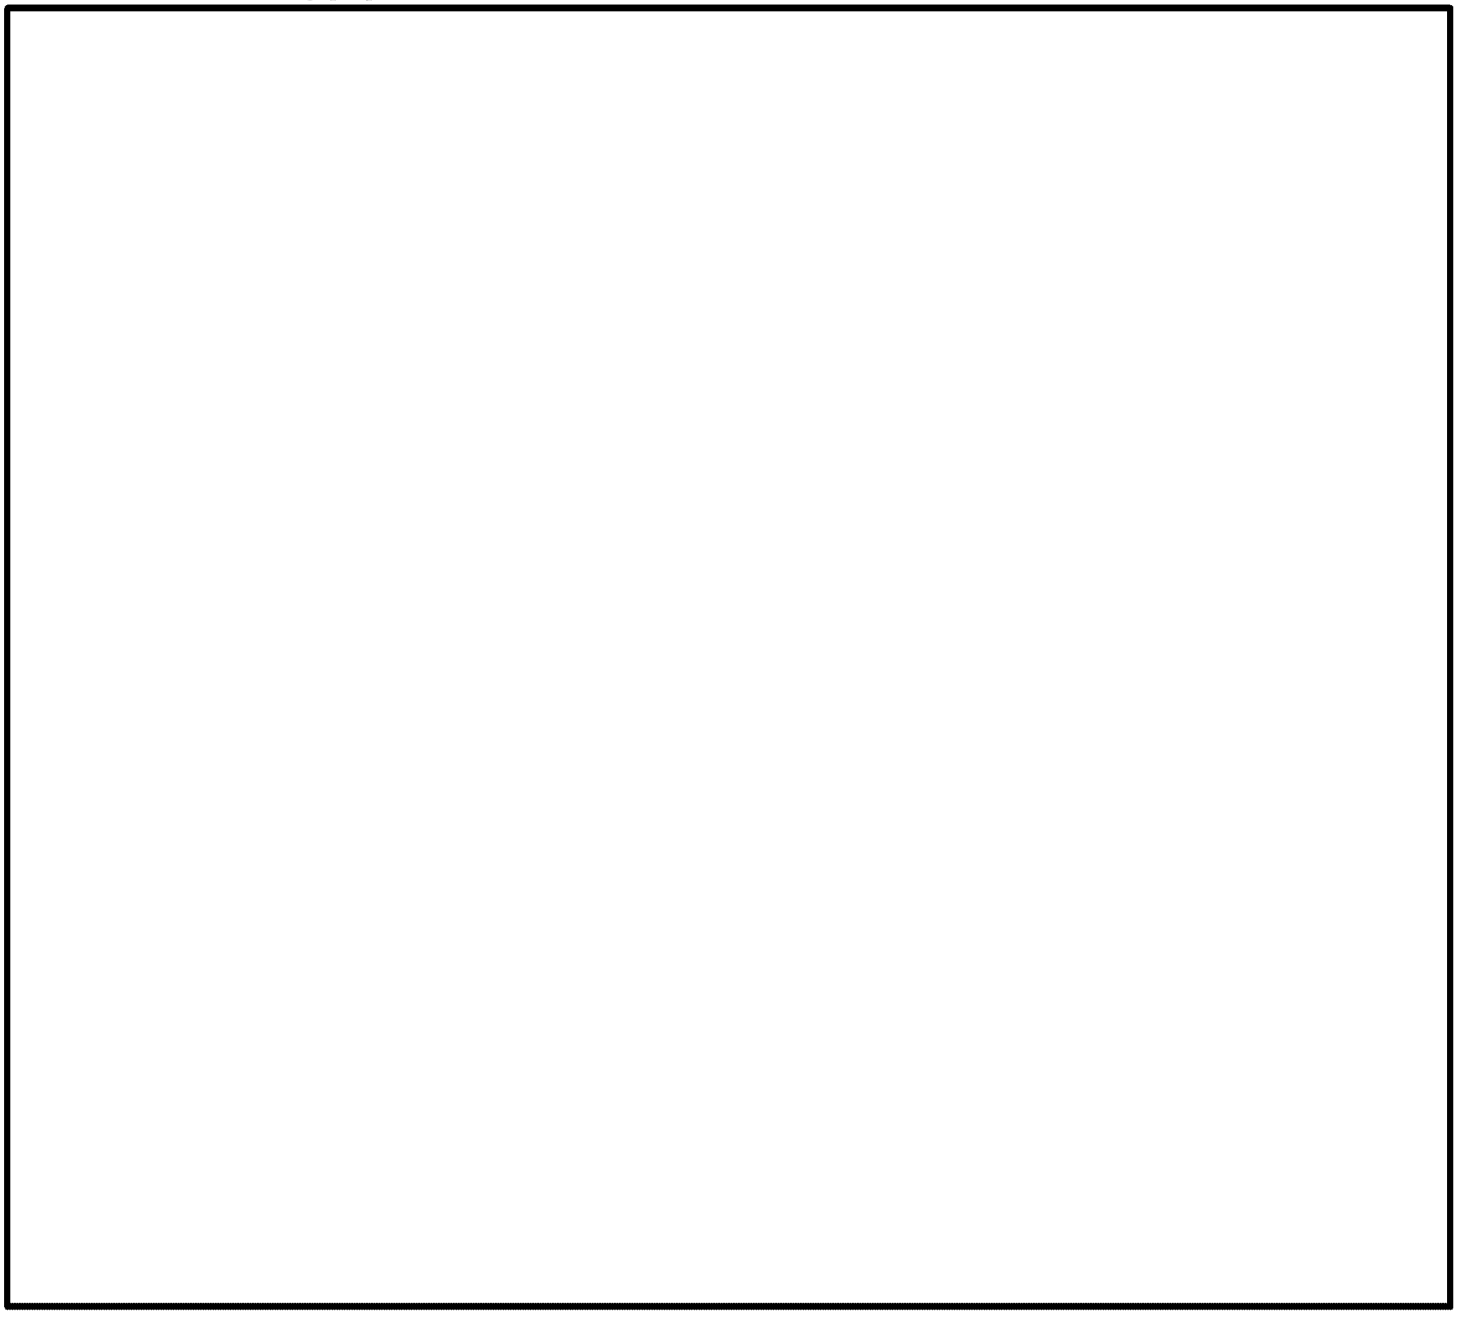
(b)(4)

FIRST FLOOR



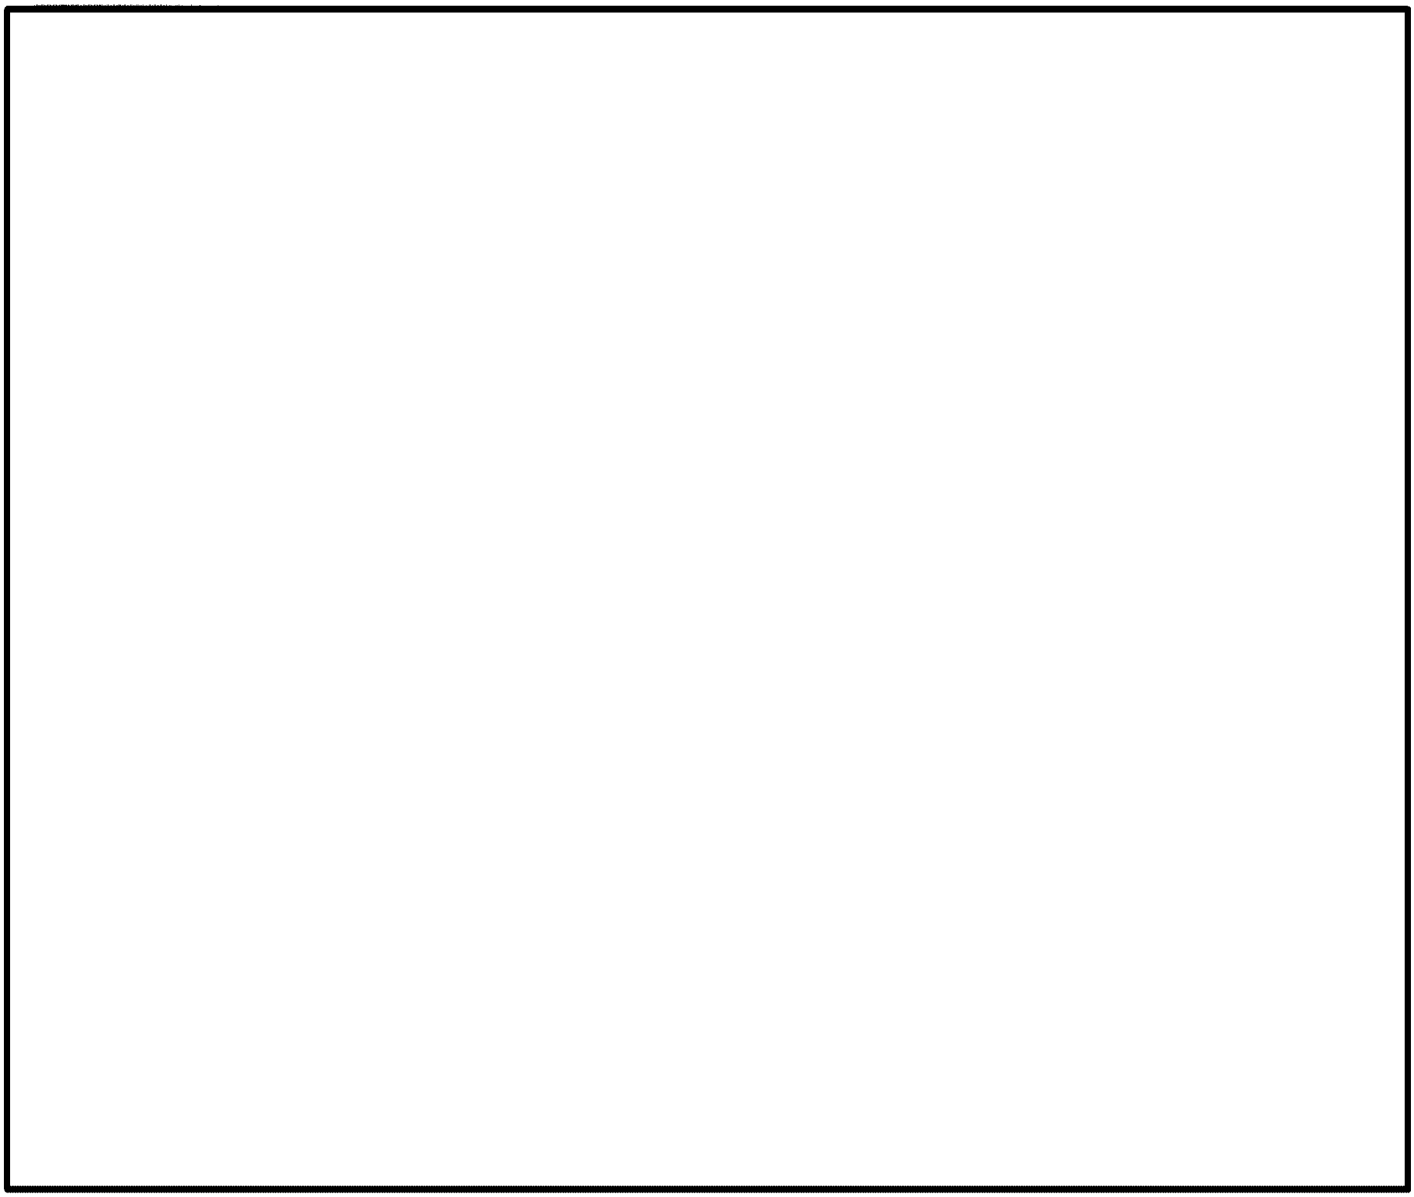
(b)(4)

SECOND & THIRD FLOORS



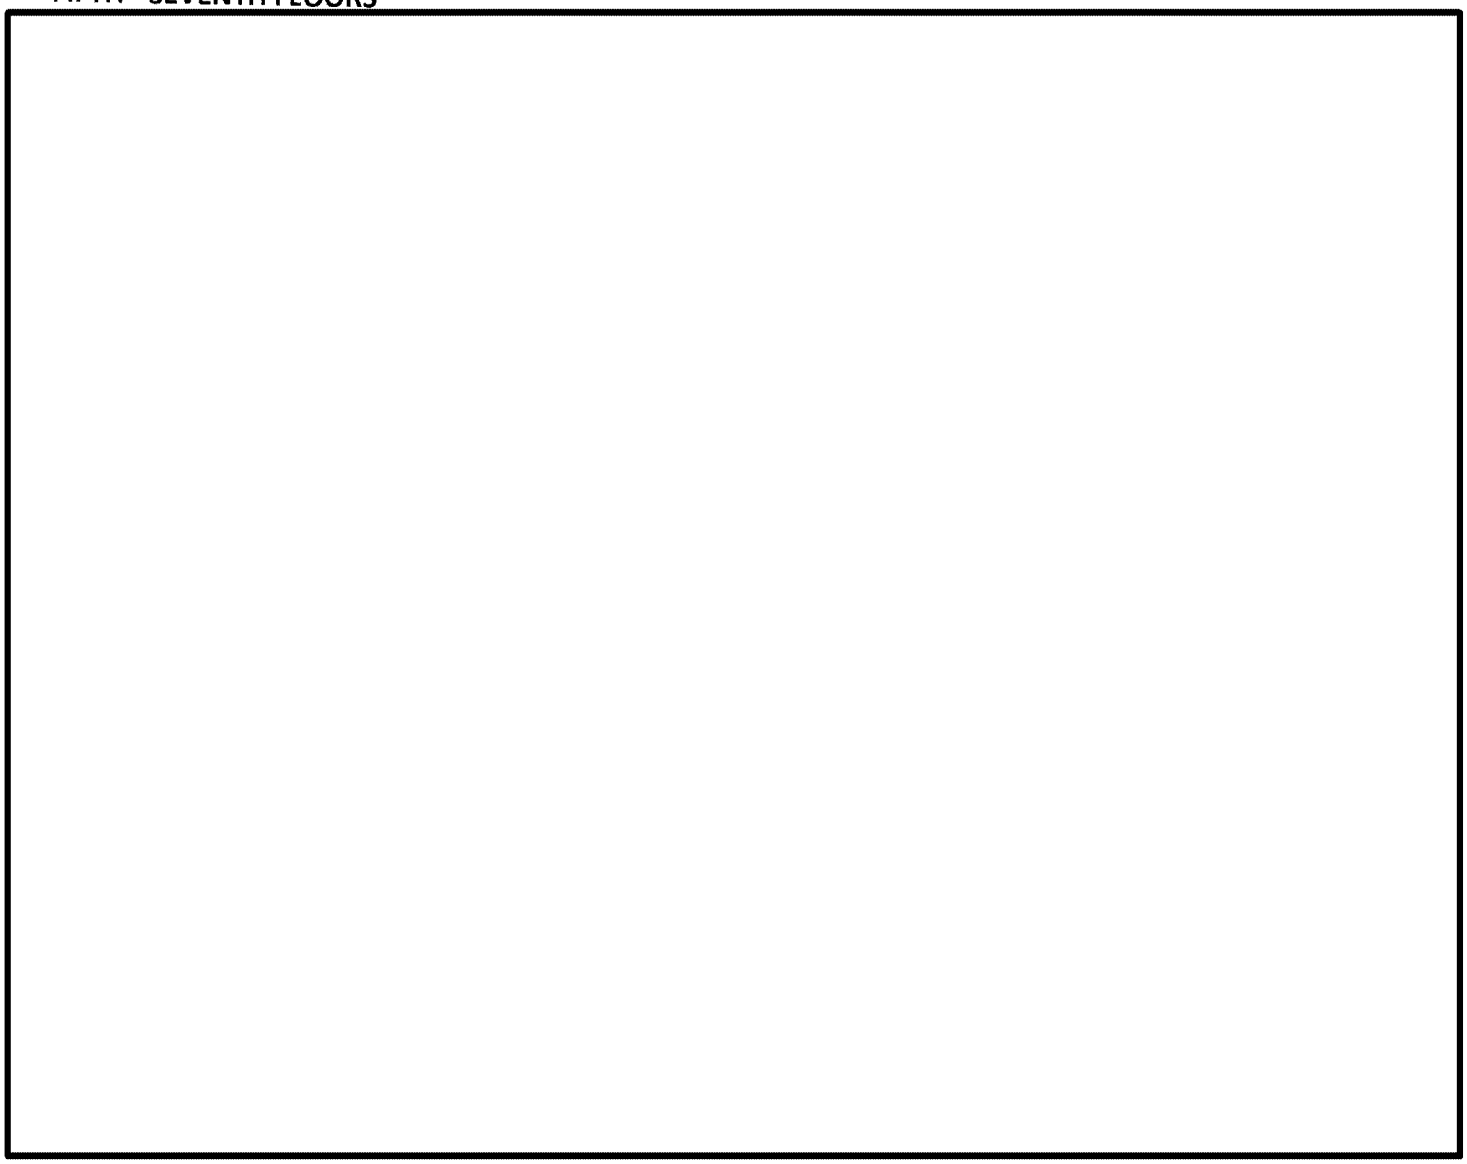
(b)(4)

FOURTH FLOOR



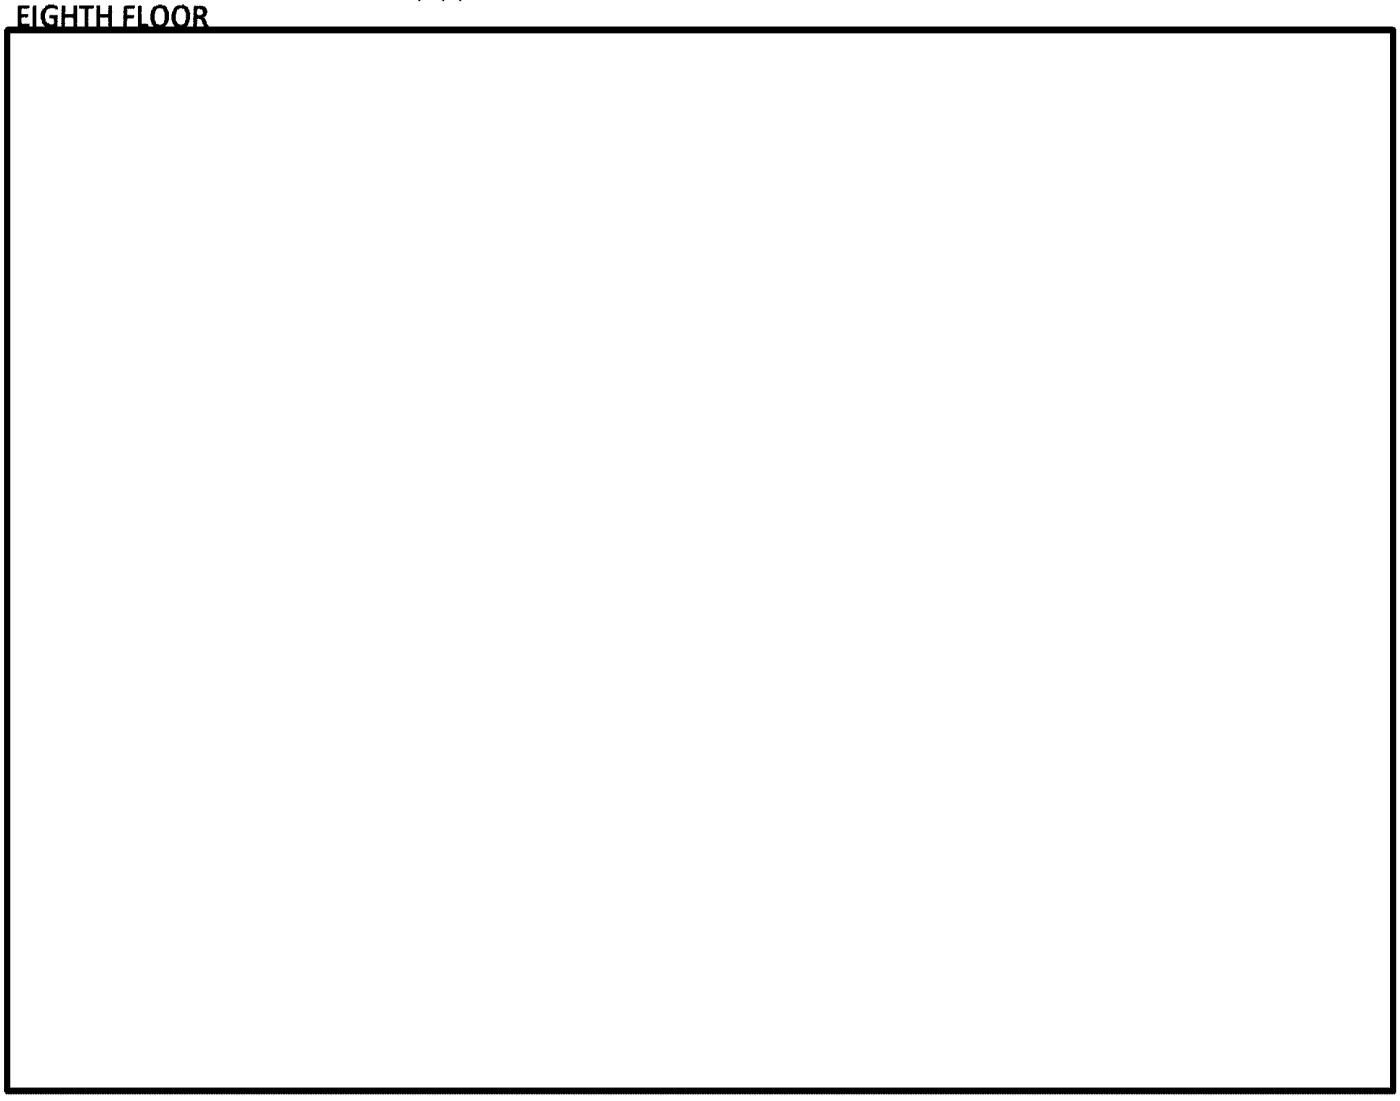
(b)(4)

FIFTH - SEVENTH FLOORS



(b)(4)

EIGHTH FLOOR



Back-of-the-House

The hotel is expected to be served by the necessary back-of-the-house space, including an in-house laundry facility, administrative offices, and a prep kitchen to service the needs of the breakfast dining area. These spaces should be adequate for a hotel of this type and should allow for the efficient operation of the property under competent management.

ADA and Environmental

We assume that the property will be built according to all pertinent codes and brand standards. Moreover, we assume its construction will not create any environmental hazards (such as mold) and that the property will fully comply with the Americans with Disabilities Act.

Capital Expenditures

Our analysis assumes that, after its opening, the hotel will require ongoing upgrades and periodic renovations in order to maintain its competitive level in this market and to remain compliant with brand standards. These costs should be adequately funded by the forecasted reserve for replacement, as long as a successful, ongoing preventive-maintenance program is employed by hotel staff.

Construction Budget

The construction budget for the 135-room subject hotel, as provided by the project developer, is illustrated in the following table.

FIGURE 4-2 PROPOSED SUBJECT HOTEL CONSTRUCTION BUDGET

Component	Cost	Cost per Room
Construction		
General		
Sitework		
Masonry		
Concrete		
Metals		
Thermal & Moisture Protection		
Doors & Windows		
Finishes		
Conveying System		
Equipment		
Mechanical		
Fire Syste		
Electrical		
Plumbing Work		
Furniture, Fixtures & Equipment

Total, Without Land		

(b)(4)

Conclusion

Overall, the proposed subject hotel should offer a well-designed, functional layout of support areas and guestrooms. All typical and market-appropriate features and amenities appear to be included in the hotel's design. We assume that the building will be fully open and operational on the stipulated opening date and will meet all local building codes and brand standards. Furthermore, we assume that the hotel staff will be adequately trained to allow for a successful opening and that pre-marketing efforts will have introduced the product to major local accounts at least six months in advance of the opening date.

5. Market Area Analysis

The economic vitality of the market area and neighborhood surrounding the subject site is an important consideration in forecasting lodging demand and future income potential. Economic and demographic trends that reflect the amount of visitation provide a basis from which to project lodging demand. The purpose of the market area analysis is to review available economic and demographic data to determine whether the local market will undergo economic growth, stabilize, or decline. In addition to predicting the direction of the economy, the rate of change must be quantified. These trends are then correlated based on their propensity to reflect variations in lodging demand, with the objective of forecasting the amount of growth or decline in visitation by individual market segment (e.g., commercial, meeting and group, and leisure).

New York City Overview

New York City is recognized as an international commercial and cultural center, and with more than eight million residents, it is one of the most populous cities in the nation and one of the largest in the world.

Renowned for its cultural attractions, entertainment, restaurants, and retail outlets, New York City is one of the most popular tourist destinations in the country. It is home to the United Nations, the Statue of Liberty, and the Empire State Building. The theaters in the Broadway district attract international attention. Lincoln Center (the home of the Metropolitan Opera, the New York Philharmonic, the New York City Ballet and Opera, and the Juilliard School) is among the world's most important centers for the performing arts. The Metropolitan Museum of Art, the Museum of Modern Art, the American Museum of Natural History, and a number of the city's other museums and galleries are internationally respected.

As the site of Wall Street, New York is the nation's financial and business capital. Manhattan's central business district contains the greatest concentration of commercial activity in the United States. New York is the home of the NASDAQ, American, and New York Stock Exchanges (NYSE), as well as a majority of the nation's investment bankers and brokers and many of the largest commercial banking institutions. In addition to financial institutions, New York City is a major center for a variety of industries, such as fashion, textiles and garments, advertising, publishing and communications, jewelry, design, and technology.

New York City is a major national and international center of commerce and culture, employing an estimated four million. It remains the financial capital of the United States, and the city's economy still relies heavily on the health of the financial sector.

The Borough of Manhattan forms the central political, financial, and cultural core of New York City and is the economic growth engine of the region. As noted previously, the City's other four boroughs are the Bronx, Brooklyn, Queens, and Staten Island. All five boroughs are well connected with one another and the region thanks to an extensive mass transit system and infrastructure network.

New York City Economic Profile

New York City is an international center for business and commerce, and workers commute from points as far as 100 miles from Manhattan. The city boasts a diverse economic base, which helps minimizing the impact of cyclical economic downturns engendered from any one particular sector.

New York City houses the headquarters of several of the nation's major commercial and investment banks. Additionally, numerous foreign banks and their subsidiaries, international advertising firms, communications and entertainment giants and publishing conglomerates have a major presence in the city. Prominent domestic firms such as Goldman Sachs, Morgan Stanley, Citigroup, and Credit Suisse are headquartered in the city, and almost every major foreign financial institution, including UBS, HSBC, Barclays, Nomura Securities, and Deutsche Bank, maintain a significant Manhattan presence. New York City is also a hub for the insurance industry, housing five of the country's ten largest insurance companies. Three of the "Big Four" accounting firms, as well as six of the top ten U.S. law firms, are headquartered in Manhattan.

New York City is home to Broadway, Lincoln Center, Carnegie Hall, Radio City Music Hall, and a variety of live performance theaters. All major TV networks – ABC, NBC, FOX, and CBS – are headquartered in the city, as well as global entertainment giants such as Viacom, Sony, and Bertelsmann. Three of the "Big Five" music recording companies are headquartered in New York. Other media/entertainment companies in the city include Time Warner, HMV, and Virgin Records. The city is also home to numerous publishing companies. Several book, magazine, and newspaper publishing companies are headquartered in New York City, including Random House, Knopf, Simon & Schuster, Condé Nast, Hachette Filipacchi, Dow Jones, and The New York Times Company.

New York agencies and branch offices of firms such as Young & Rubicam and Burson Marsteller dominate the list of the world's ten largest advertising and public relations agencies.

New York City's economy benefits greatly from the breadth of its corporate headquarters and related services industry. The city has acted as the nation's foremost commercial center due to the synergy created by the large concentration of corporations and service firms, which complement primary goods producers.

Overview of the Borough of Queens

The Borough of Queens (Queens County) is bounded to the north and northwest by the East River, to the east by Long Island's Nassau County, to the south by the Atlantic Ocean, and to the southwest by Brooklyn. Queens County encompasses ±71,780 acres of land, representing 34.9% of the total area of New York City.

Queens is one of the most ethnically diverse communities in the U.S. It has served as a bedroom community for Manhattan, but has also developed its own employment base. The two major airports, JFK International and LaGuardia, have played an important role in shaping the area's economy. The Borough of Queens is home to more than 34,500 businesses, ranging from small retail outlets to large manufacturing plants. No single company or industry is dominant, although health care, air transportation, and services are major sectors. Some of Queens' largest employers include Steinway & Sons, British Airways, St. John's University, and Citibank.

More than 59% of Queens's residents commute to Manhattan for work. Of the 41% of workers who remain in Queens for employment, 32% work in the services industry, 21% in retail, 15% in public utilities, 11% in manufacturing, 8% in government, 7% in construction, and 6% in FIRE (finance, insurance, and real estate).

Although Queens has never been a major center for office development, the retail sector has benefited from the area's concentration of residential developments. Downtown Jamaica, which is located north of the subject property, in central Queens, is one of the largest concentrations of retail space in New York City, attracting visitors from throughout the region, owing to the appealing prices offered by the local merchants. However, Queens still exports a disproportionate share of its retail spending to neighboring Manhattan and Nassau County.

While not as rich in tourist attractions as Manhattan, the Borough of Queens offers its own array of leisure-oriented sites. The following table lists selected visitor attractions located in Queens.

FIGURE 5-1 SELECTED QUEENS VISITOR ATTRACTIONS

Attraction	Type	Location	Notes
Citi Field	Sports	Flushing	Home baseball park of New York Mets
Flushing Meadows-Corona Park	Park	Corona	Home of the 1954 World's Fair, featuring a zoo, a boating lake, a skate park, a barbecue area, playfields, and an aquatic and hockey center.
Louis Armstrong House Museum	Museum	Flushing	Music, photos, films, instruments, awards
MoMA PSA	Museum	Long Island City	contemporary art museum showcases new and innovative work
Museum of the Moving Image	Museum	Astoria	high-tech museum dedicated to multimedia arts, with a particular emphasis on film
New York Hall of Science	Museum	Corona	450-exhibit, hands-on science center
Queens Botanical Garden	Garden	Flushing	Acres of plantlife, including a Japanese Garden
Queens County Farm Museum	Museum	Floral Park	47 acres, including a historic farmhouse, as well as livestock and planting fields
Queens Zoo	Zoo	Flushing	11-acre zoo with North American wildlife
Resorts World Casino	Casino	Jamaica	Up to 5,000 slots and electronic table games and a variety of dining and shopping options
Socrates Sculpture Park	Park	Long Island City	Specifically designated for artists to create outdoor works, with views of Manhattan skyline
USTA National Tennis Center	Sports	Flushing	Home of U.S. Open

Unemployment

The following table sets forth unemployment data for New York City, the New York-Northern New Jersey-Long Island, NY-NJ-PA MSA, New York State, and the nation.

FIGURE 5-2 UNEMPLOYMENT STATISTICS

Year	City	MSA	State	U.S.
2005	5.8 %	4.9 %	5.0 %	5.1 %
2006	5.0	4.5	4.5	4.6
2007	5.0	4.4	4.6	4.6
2008	5.6	5.3	5.4	5.8
2009	9.3	8.6	8.3	9.3
2010	9.5	8.9	8.6	9.6
2011	9.1	8.6	8.3	8.9
2012	9.4	8.7	8.5	8.1
2013	8.8	7.9	7.7	7.4
2014	7.2	6.4	6.3	6.2
Recent Month - May				
2014	7.3 %	6.4 %	6.2 %	6.3 %
2015	5.9	5.6	5.3	5.5

* Letters shown next to data points (if any) reflect revised population controls and/or model re-estimation implemented by the BLS.

Source: U.S. Bureau of Labor Statistics

The unemployment rate for the U.S. fluctuated within the narrow range of 4.6% to 5.5% in the period spanning from 2004 to 2007. The recession and financial crisis in 2007 and 2008 resulted in heightened unemployment rates, which peaked at 10.0% in October 2009. Job growth resumed in late 2009; the national unemployment rate has steadily declined since 2010. Total nonfarm payroll employment increased by 223,000, 280,000, and 223,000 in the most recent months of April, May, and June respectively, with gains relatively widespread and particularly strong in the professional and business services, leisure and hospitality, and health care categories. The unemployment rate was reported to be 5.3% in June 2015, just under the 5.5% rate registered in April and May. The positive gains in employment reflect steady progress by the U.S. economy.

In 2008, the impact of the subprime mortgage crisis broadened, as the financial services sector, on which New York City is particularly reliant, weakened significantly. As a result, year-end unemployment figures for 2008 illustrated increases for New York County and the MSA. In 2009, unemployment figures for both areas illustrated substantial increases as a result of the deepening national recession. The New York area began to show signs of economic improvement beginning in 2010. Although unemployment rates slightly increased in 2012, 2013 reflected a return to a decreasing trend. The 2014 data shows considerable drops in unemployment across the board, from New York City to the nation. We expect these levels to continue to improve as the national economy recovers.

Tourism

New York City is one of the most popular and frequently visited destinations in the United States. In 2013, New York City is estimated to have accommodated roughly 54.3 million visitors - a record level. Of the overall visitation figure, roughly 11.4 million hailed from international markets, maintaining the City's rank as the number one U.S. destination for overseas travelers. City officials estimate the overall economic impact of tourism in 2013 to be $58.7 billion. Direct visitor spending was estimated to be $39.4 billion, up from $36.9 billion in 2012. Given such performance, former Mayor Bloomberg said the city is on pace to reach 55 million annual visitors by the end of 2014, one year ahead of his administration's target date.

According to most market observers, such record levels could not been realized without the expanded availability of hotel rooms in New York City. In fact, as illustrated by the tourism data in the following, the four highest tourism levels have all been recorded over the past four years - the period of highest availability of inventory in the market.

Airports

The New York City area is served by three major airports: John F. Kennedy (JFK) International, LaGuardia (LGA), and Newark Liberty International (EWR). The following table presents a summary of historical passenger activity at these facilities.

FIGURE 5-5 PASSENGER STATISTICS – REGION'S THREE MAJOR AIRPORTS

	LaGuardia Airport		JFK Intl. Airport		Newark Liberty Intl. Airport		All Three Airports	
Year	Total Passengers	Percentage Change	Total Passengers	Percentage Change	Total Passengers	Percentage Change	Total Passengers	Percentage Change
1998	22,849,071	—	31,043,726	—	32,520,692	—	86,413,489	—
1999	23,926,923	4.7 %	31,708,431	2.1 %	33,622,686	3.4 %	89,258,040	3.3 %
2000	25,374,866	6.1	32,856,220	3.6	34,188,468	1.7	92,419,554	3.5

2015	8,423,803	3.3 %	16,506,429	6.0 %	11,290,585	4.9 %	36,220,817	5.0 %

Source: Port Authority of New York and New Jersey

As detailed, after incurring overall passenger activity declines in 2008 and 2009 due to the impact of the latest recession, statistics have improved since 2010. Overall passenger count rebounded by roughly 2% in each - 2010 and 2011. In 2012, overall passenger count for the area increased at a stronger rate of 3.3%, and the momentum continued through 2014. The latest year-to-date figures indicate accelerated growth, largely attributable to the 6.0% growth at JFK International.

LaGuardia Airport Expansion

LaGuardia Airport is a leading domestic and business travel gateway for the region; many major commercial airlines service the airport. LaGuardia is one of the three major airports serving the New York City area, along with the John F.

Kennedy International Airport and Newark Liberty International Airport in New Jersey. The facility is located in the borough of Queens, just eight miles from Midtown Manhattan. In October of 2010, construction was completed on a new state-of-the-art air-traffic-control tower to replace a tower that was built in 1962. In 2012, Delta completed a $160-million renovation and expansion project at LaGuardia, including the construction of the 600-foot connector bridge between Terminals C and D and the creation of the new Delta Sky Club. In July 2015, New York Governor Andrew Cuomo announced plans to completely overhaul the airport. Pending approval from the Port Authority of New York and New Jersey's board of directors, the $4-billion project is expected to break ground in early 2016 with initial phases opening by 2019, followed by the completion of later phases through 2021. The project calls for the demolition of existing terminal buildings and the construction of a new central terminal closer to the Grand Central Parkway, as well as a connection to Delta's Terminals C and D. The placement of the terminal closer to the highway is expected to add two miles of usable aircraft space, allowing for an improved taxi system and ultimately reducing aircraft congestion and flight delays. Plans also call for enhanced airport accessibility via public transportation, with planned linkages to MTA subway lines and the Long Island Railroad via AirTrain, as well as high speed ferry service to Manhattan.

JFK Airport Expansion

JFK airport is currently under expansion. In 2010, the Port Authority approved a plan to demolish Terminal 3 and construct a new state-of-the-art terminal to replace aging Terminal 4. The $1.2-billion project commenced in 2011 and the first phase of this project was completed in May 2013. Terminal 4 is occupied by Delta Air Lines and the opening of the first phase includes an expanded security area with 16 lanes, improved check-in areas, a centralized security checkpoint, a new 24,000 square-foot Sky Club, an improved baggage handling system, as well as improved Customs and Border Protection baggage claim and re-check facilities. Phase two of the Terminal 4 redevelopment plan will include an additional 11 gates on Terminal 4's Concourse B and is expected to be completed in summer 2015. Currently Terminal 4 hosts 30 international and domestic airlines with an annual passenger volume of nearly 11 million. By 2014, passenger volume is expected to increase to 15 million.

Woods & Poole Economic and Demographic Review

In addition to the data outlined earlier in this section, we have provided a summary of economic and demographic statistics compiled by Woods & Poole Economics, Inc., a well-regarded forecasting service based in Washington, DC. In addition to information for the Borough of Queens, statistics are also provided for the New York-Northern New Jersey-Long Island, NY-NJ-PA Metropolitan Statistical Area (MSA). The MSA consists of New York City's five boroughs and the New York Counties of Nassau, Putnam, Rockland, Suffolk and Westchester; the New Jersey

Counties of Bergen, Essex, Hudson, Hunterdon, Middlesex, Monmouth, Morris, Ocean, Passaic, Somerset, Sussex, and Union; and Pike County, Pennsylvania. Data for the State of New York and the nation as a whole are also provided.

These figures are set forth in the following table. All dollar amounts have been adjusted for inflation by Woods & Poole, and thus they reflect real change. We note that the percent changes indicated in the following table are based on unrounded figures; consequently, they may not calculate exactly. Historical and projected employment for the MSA is summarized in the second table.

Market Area Conclusion

Reflective of the impact of the latest recession, economic indicators for New York City illustrated worsening trends through most of 2009. However, New York City rebounded well over the last three quarters of 2010 and the first half of 2011. The recovery has slowed somewhat in 2012 due to a meeker domestic recovery process and the European debt crisis. However, in 2013, a stronger growth trend resumed, and the growth accelerated through 2014, as evidenced in lower unemployment rates, peak level of tourism, and continuous improvement in airport passenger statistics. Considering its diverse and expansive economic base, the outlook for the New York City market remains positive, with a potential for particularly strong growth when the global economic recovery intensifies.

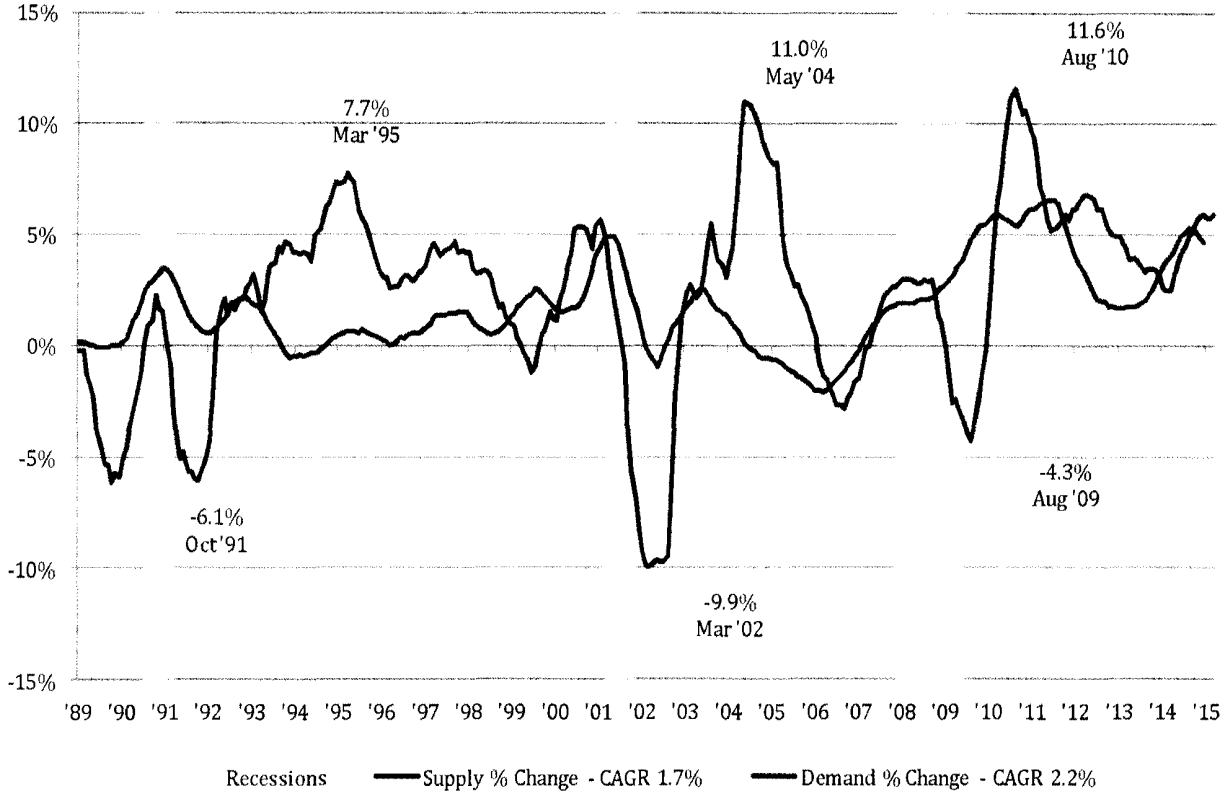
6. Manhattan Lodging Overview

Historical Trends

Hotel performance in the Manhattan lodging market has experienced some wide fluctuations over the course of up and down economic cycles over the past 27 years. Between January 1989 and March 2015, the market was affected by three national recessions, which produced some dramatic dips in demand. The first two recessions (in 1990/91 and 2001, respectively) lasted approximately eight months, while the most recent began in late 2008 and stretched for 18 months—making it the most serious and prolonged economic setback in the U.S. since World War II.

The following graph illustrates the dynamics between supply and demand in Manhattan from January 1989 through March 2015, showing percent changes in supply and demand as a twelve-month moving average. The recessionary periods, which were all followed by a sharp decline in demand, are highlighted in yellow.

FIGURE 6-1 LONG-TERM SUPPLY AND DEMAND PERCENT CHANGES: 12-MONTH MOVING AVERAGE



Source: HVS, STR, and National Bureau of Economic Research

Notably, the minor decline in demand in 2006 was a result of the massive popularity of an art exhibit held in Central Park in the winter of 2005; the exhibit, known as "The Gates," attracted between 1 and 1.5 million additional visitors to Manhattan during the low season for tourism, and demand normalized the following year. The conversion of several hotels to condominiums during that period further contributed to the decline in demand. Demand declines in Manhattan have been typically short-lived (between 12 to 16 months) and followed by steep increases, a testament to the market's resiliency.

The most recent and most serious recession (in terms of duration and severity) coincided with a sharp increase in hotel supply in the Manhattan lodging market. Nevertheless, hotel demand did not suffer as much as during the previous two recessions. Demand bottomed out at -4.3% in August 2009, whereas demand fell -9.9% in March 2002 and -6.1% in October 1991. Manhattan hotel demand also experienced its strongest rebound following the 2008/09 recession. In August 2010, the Manhattan market registered an increase in demand of 11.6%—the strongest year-over-year growth in demand over the last 27 years.

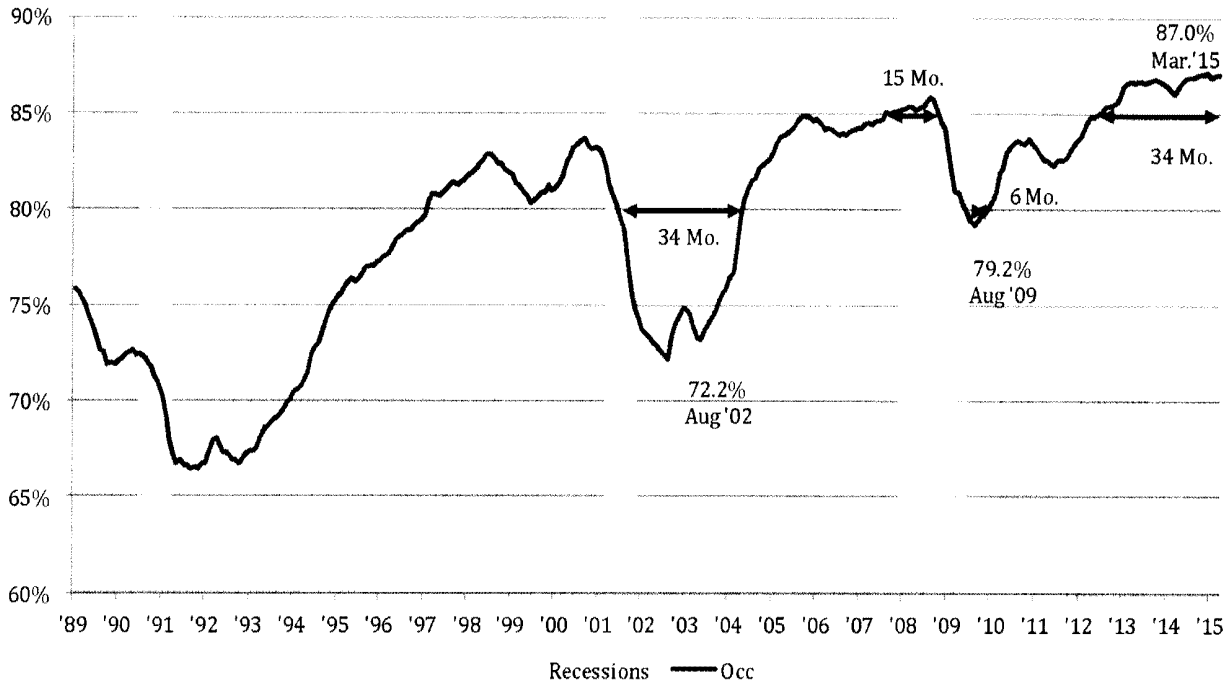
This dramatic recovery reflects Manhattan's growing diversity of major demand generators. New York City boasts a status as the world's financial capital, with international banking and investment institutions drawing in commercial travelers year round. The city is also an international cultural destination, and leisure travelers descend on Manhattan by the millions each year, particularly in the spring and summer months. Tourism and commercial business continues to expand in the market, increasing the call for hotel rooms and supporting strong demand fundamentals for local hotels.

Strong barriers to entry in the Manhattan market have meant a minimal expansion of hotel supply over the last 27 years. From 2004 through 2006, supply actually decreased because of the conversion of several hotels to condominiums. Since early 2009, however, the market has consistently registered strong increases in supply each month. From January 2009 to March 2015, supply increased by 29.3%. During each month from December 2009 through January 2012, supply growth exceeded 5%. The pipeline of new supply slowed somewhat in the years that followed, but picked up from October 2014 through January 2015, surpassing 5% growth per month yet again.

Historically, the Manhattan market has been undersupplied. For more than a quarter century, compounded average annual demand growth has outpaced corresponding growth in supply, as indicated in the previous chart. Manhattan ranks among a select few of the top 25 U.S. lodging markets that have maintained such a positive differential between supply and demand.

Manhattan's favorable supply and demand dynamics have translated into strong occupancy levels for area hotels, despite some relatively brief occupancy declines over the past 27 years. The following graph illustrates occupancy trends as a twelve-month moving average from January 1989 to March 2015.

FIGURE 6-2 LONG-TERM OCCUPANCY LEVELS: 12-MONTH MOVING AVERAGE



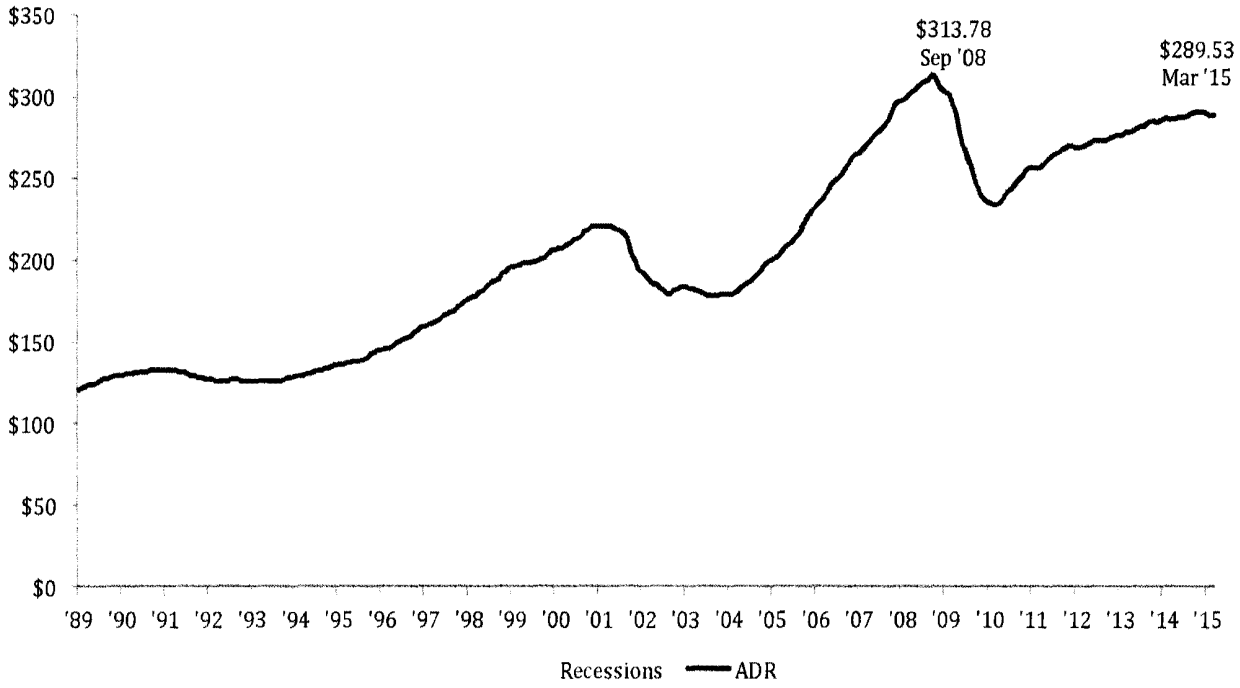
Source: HVS, STR, and National Bureau of Economic Research

Occupancy in Manhattan suffered some volatility over the illustrated period, particularly during the recessions of the early 1990s and 2000s. Occupancy recovered, however, and held fast in the mid-80% range from 2005 through 2008, which suggests that Manhattan hotels, overall, were at close to maximum capacity during this time.

While the 2008/09 recession once again sent occupancy reeling, the decline was not nearly as severe or drawn out as that following the 2001 recession, despite the increase in hotel supply. Occupancy dipped below the 80% threshold for only six consecutive months in 2009, whereas occupancy remained in the low-to-mid 70% range from July 2001 to April 2004—a span of 34 months. Comparative growth over the same periods illustrates occupancy's relatively strong recovery following the most recent downturn. During the expansion period following the 2001 recession, occupancy remained above 85% for 15 consecutive months. As of March 2015, occupancy has remained above 85% for 34 consecutive months, hitting an all-time high of 87.2% in December 2014.

The following graph illustrates average rate levels as a twelve-month moving average for Manhattan hotels from January 1989 to March 2015.

FIGURE 6-3 LONG-TERM ADR LEVELS: 12-MONTH MOVING AVERAGE

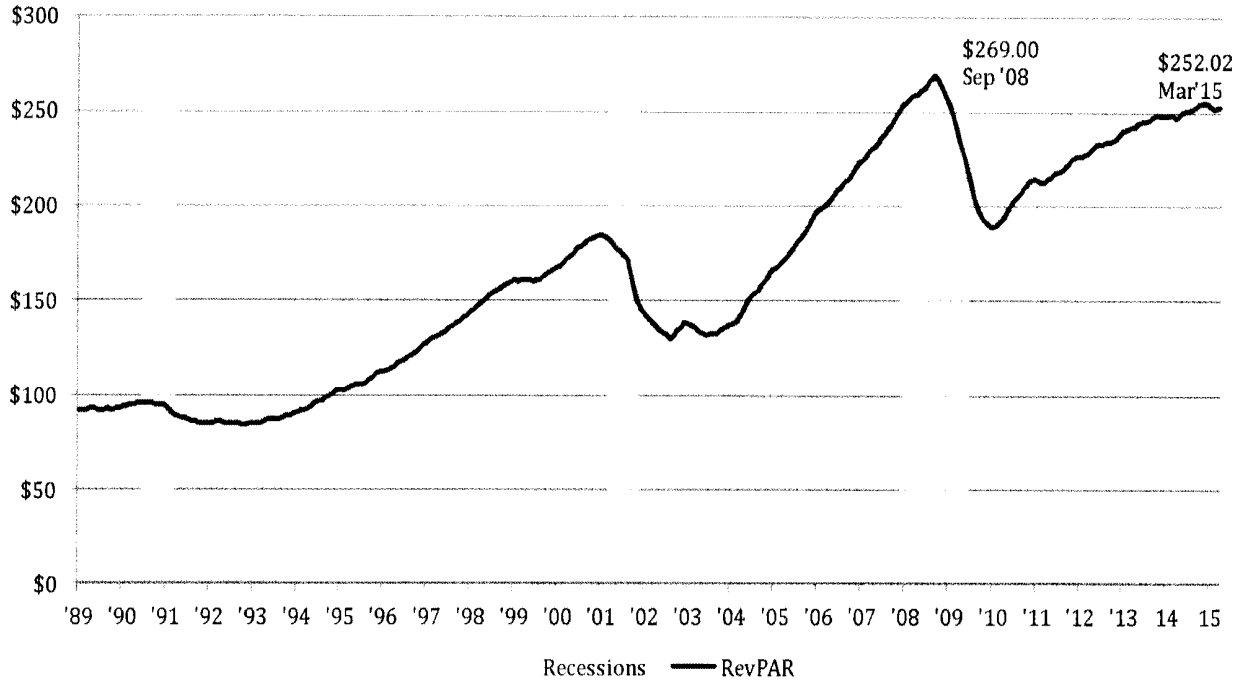


Source: HVS, STR, and National Bureau of Economic Research

Registering at $289.53 as of March 2015, average rate sat approximately 7.7% below its prior peak of $313.78 in September 2008. Average rate had reached a post-recession height of $292.33 in October 2014. Unlike occupancy in the market, which has soared since the last recession, both average rate and RevPAR levels for Manhattan hotels have yet to fully recover from the downturn.

The following graph illustrates RevPAR levels in the Manhattan lodging market from January 1989 to March 2015.

FIGURE 6-4 LONG-TERM REVPAR LEVELS: 12-MONTH MOVING AVERAGE



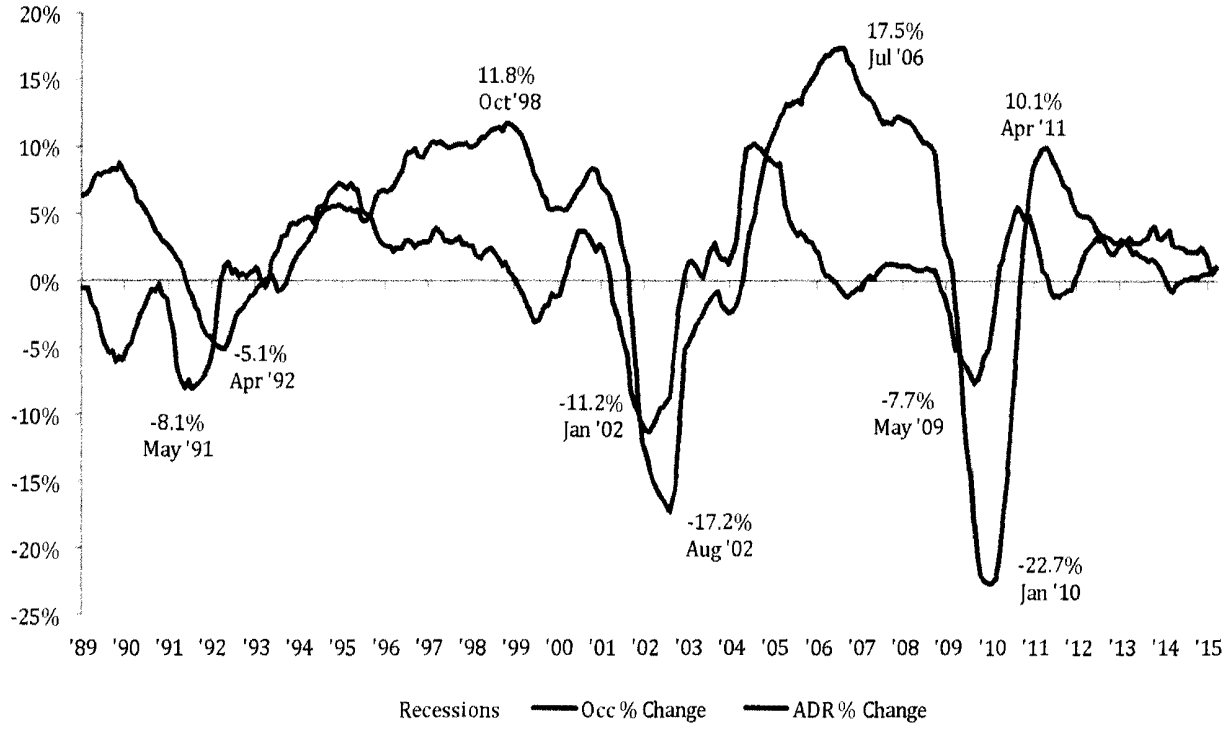
Source: HVS, STR, and National Bureau of Economic Research

Like average rate, RevPAR in Manhattan has leveled off in the past year. Despite almost five years of steady gains, the latest available figures (from March 2015) show RevPAR approximately 6.3% below its historical peak in September 2008. Both average rate and RevPAR for Manhattan hotels have increased significantly since 1989, particularly during the expansion period following the 2001 recession.

RevPAR has been slower to recover from the most recent recession. Compounded annual growth from January 2010 to June 2012 was 8.6%, indicating a strong pace of recovery; however, compounded annual growth for the subsequent two and one-half years (from July 2012 through December 2014) was only 3.6%. This deceleration in recovery has postponed the market's ability to surpass the 2008 historical peak.

The following graph illustrates percent changes in occupancy and average rate as a twelve-month moving average from January 1989 to March 2015.

FIGURE 6-5 LONG-TERM OCCUPANCY AND ADR % CHANGES: 12-MONTH MOVING AVERAGE



Source: HVS, STR, and National Bureau of Economic Research

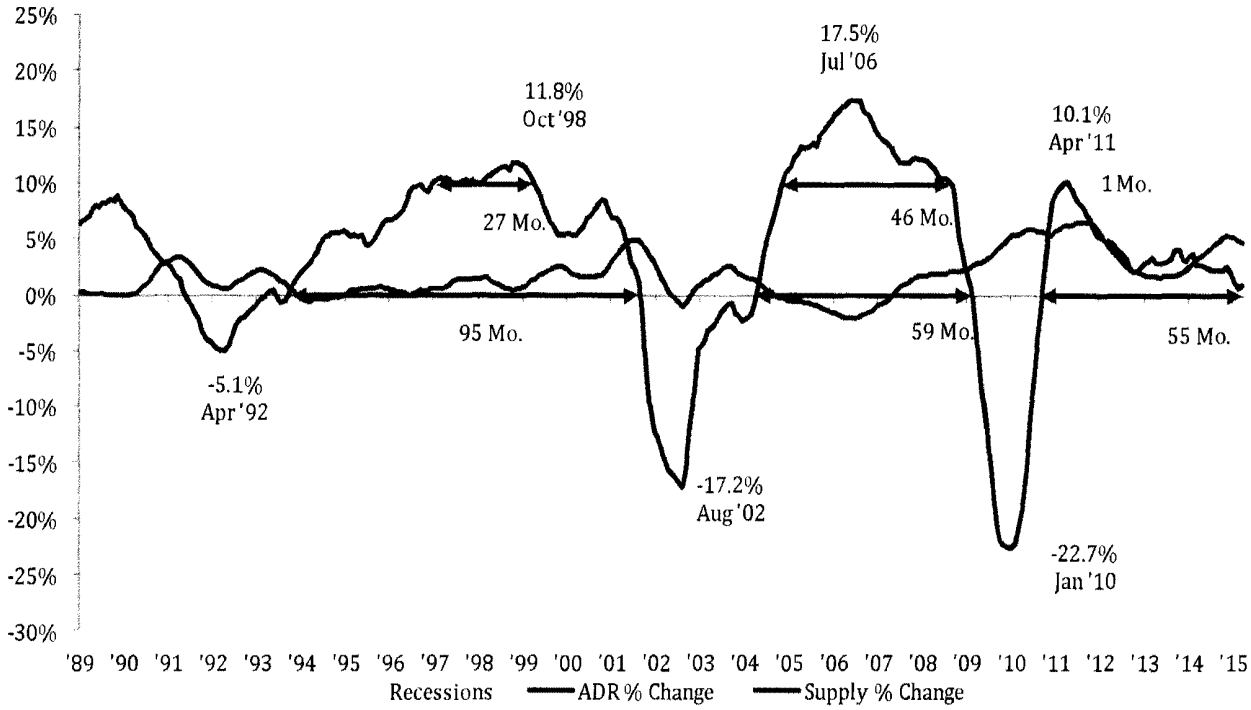
Average rate volatility in the Manhattan lodging market has become more pronounced over the illustrated period; however, it is worthy to note that this trend in part reflects the growing number of hotels reporting average rates to STR Global or through online resources such as Expedia. The immediate availability of lodging data has created a higher level of transparency in the market, enabling local hotel operators to quickly react to shifts in competitors' average rates.

The most dramatic shifts in average rate came in the wakes of past recessions, as hotel operators cut prices to capture more rate-conscious demand. Average rates have demonstrated a capacity to rebound following some of the most precipitous declines. Average rate in Manhattan plummeted 17.2% in August 2002; four years later, however, rates surged by a comparable magnitude of 17.5%.

Relatively healthy occupancy levels in Manhattan during and following the 2008/09 recession came largely at the expense of even more sizeable cuts in average rate; percent change in average rate bottomed out at 22.7% in January 2010. Nevertheless, average rate rebounded faster and stronger following the most recent recession than after either of the previous two contractions.

The following graph illustrates percent changes in hotel supply and average rate as a twelve-month moving average from January 1989 to March 2015.

FIGURE 6-6 LONG-TERM SUPPLY AND ADR % CHANGES: 12-MONTH MOVING AVERAGE



Source: HVS, STR, and National Bureau of Economic Research

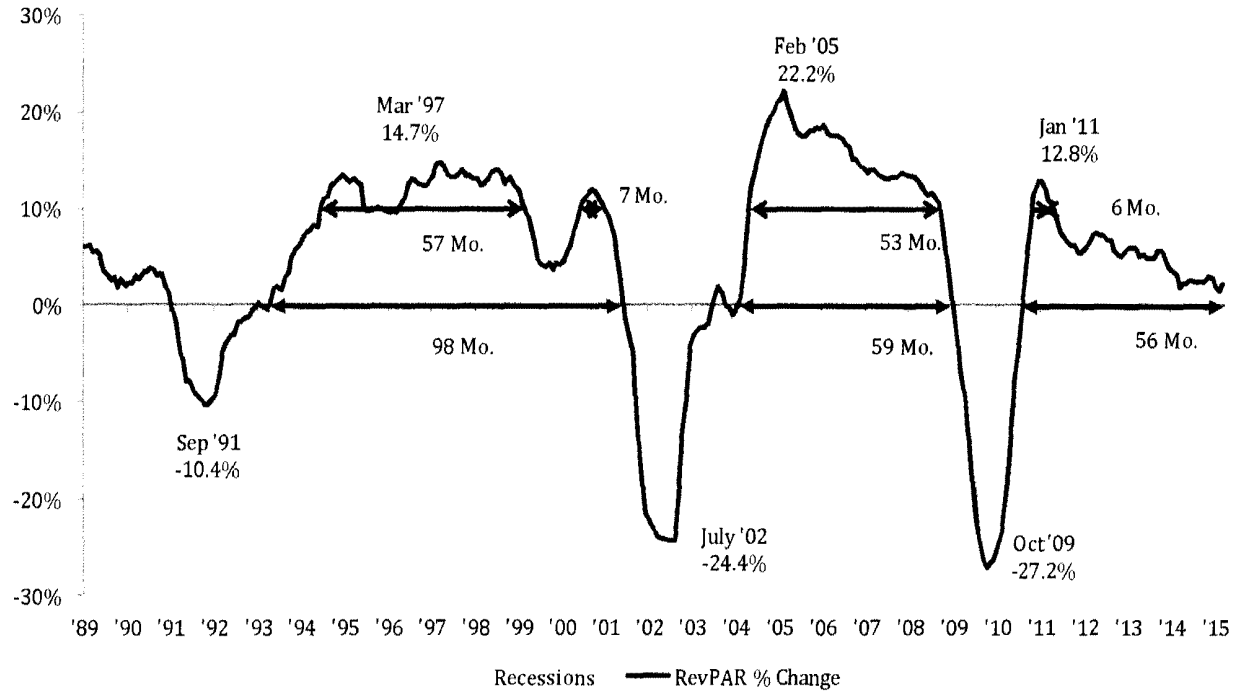
Periods of economic recovery and expansion in a lodging market are characterized by strong growth in average rates, and this has been evident in Manhattan. The market realized 27 consecutive months of double-digit increases in average rate from January 1997 to March 1999, followed by 46 consecutive months of rising average rates from November 2004 to August 2008. The market experienced its steepest rise in average rate growth during the expansion period following the 2001 recession, which coincided with decreases in supply.

Since the most recent recession, the market has experienced only one month of double-digit average rate growth: 10.1% in April 2011. The somewhat repressed recovery of average rate in Manhattan largely reflects an upward shift in hotel supply. The significant number of new hotels entering the market since early 2009 has not negatively affected occupancy; however, the additional inventory has limited the ability for hotel operators to raise average rates. This trend remains evident in 2015; while average rates have stayed in positive territory (that is, above the 0% threshold) over

the last 55 months, the growth has been moderate and has decelerated over the past three years.

The following graph illustrates RevPAR percent changes from January 1989 to March 2015 as a twelve-month moving average.

FIGURE 6-7 LONG-TERM REVPAR % CHANGES: 12-MONTH MOVING AVERAGE



Source: HVS, STR, and National Bureau of Economic Research

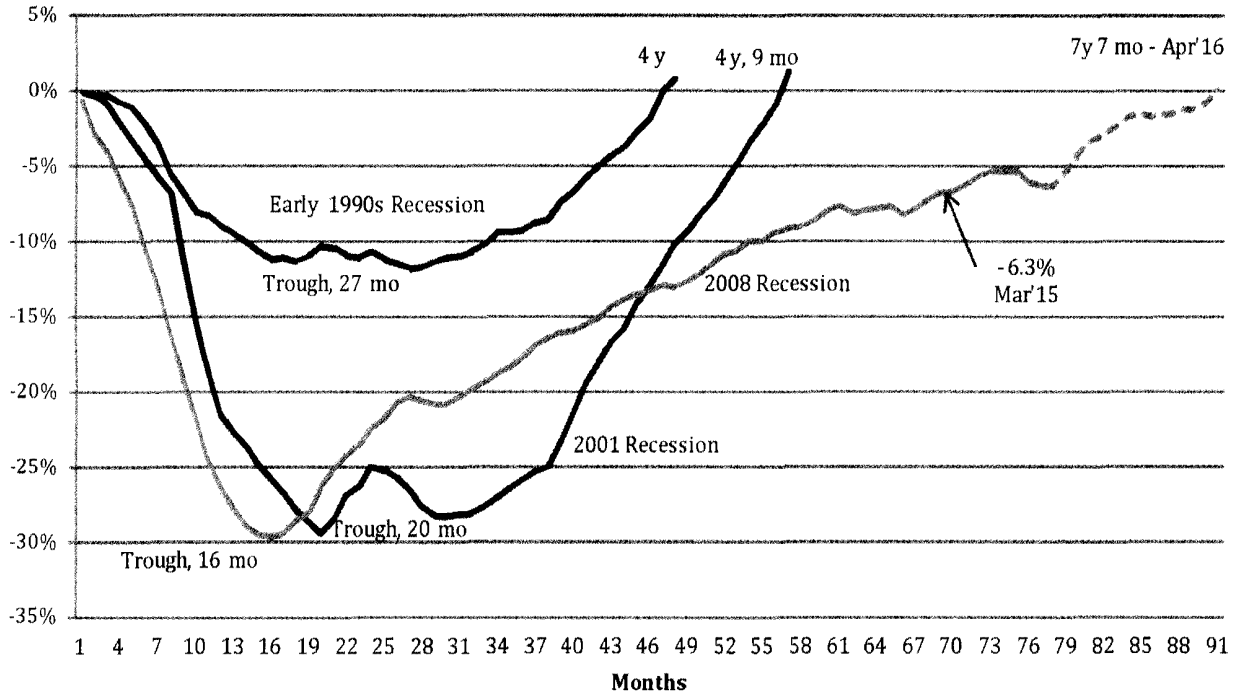
Since 1987, RevPAR has increased at an average annual rate of 4%. The Manhattan market experienced 57 consecutive months of double-digit increases in RevPAR from June 1994 to February 1999, and another 53 consecutive months of increases from May 2004 to September 2008. RevPAR percent change peaked in February 2005 at 22%, bottoming out at -27.2% in October 2009 amidst the negative impact of the recession. RevPAR in Manhattan had fallen by -24.4% in the wake of the previous recession in July 2002.

RevPAR for Manhattan hotels was quicker to rebound following the most recent recession than after the previous two contractions, primarily fueled by rapidly achieved gains in average daily rate. As of March 2015, however, the Manhattan hotel market had experienced only six consecutive months of double-digit increases in RevPAR, from November 2010 to April 2011. Despite a strong initial recovery, RevPAR growth has decelerated since 2011 and has remained below 5% since November 2013. Significant

increases in RevPAR through 2015 and into 2016 are unlikely, as occupancy is forecast to remain relatively stable in the mid-80% range, with average rates anticipated to grow in the single digits over the same period. As such, the current recovery and expansion for the market is forecast to span much longer than those of the previous two economic recessions. Again, the unprecedented expansion of hotel supply in Manhattan over the past six years has, more than any other factor, put pressure on the city's RevPAR recovery.

The following graph illustrates RevPAR cycles through the last three recessions as a twelve-month moving average.

FIGURE 6-8 REVPAR CYCLES THROUGH LAST THREE RECESSIONS: 12-MONTH MOVING AVERAGE



Source: HVS and STR

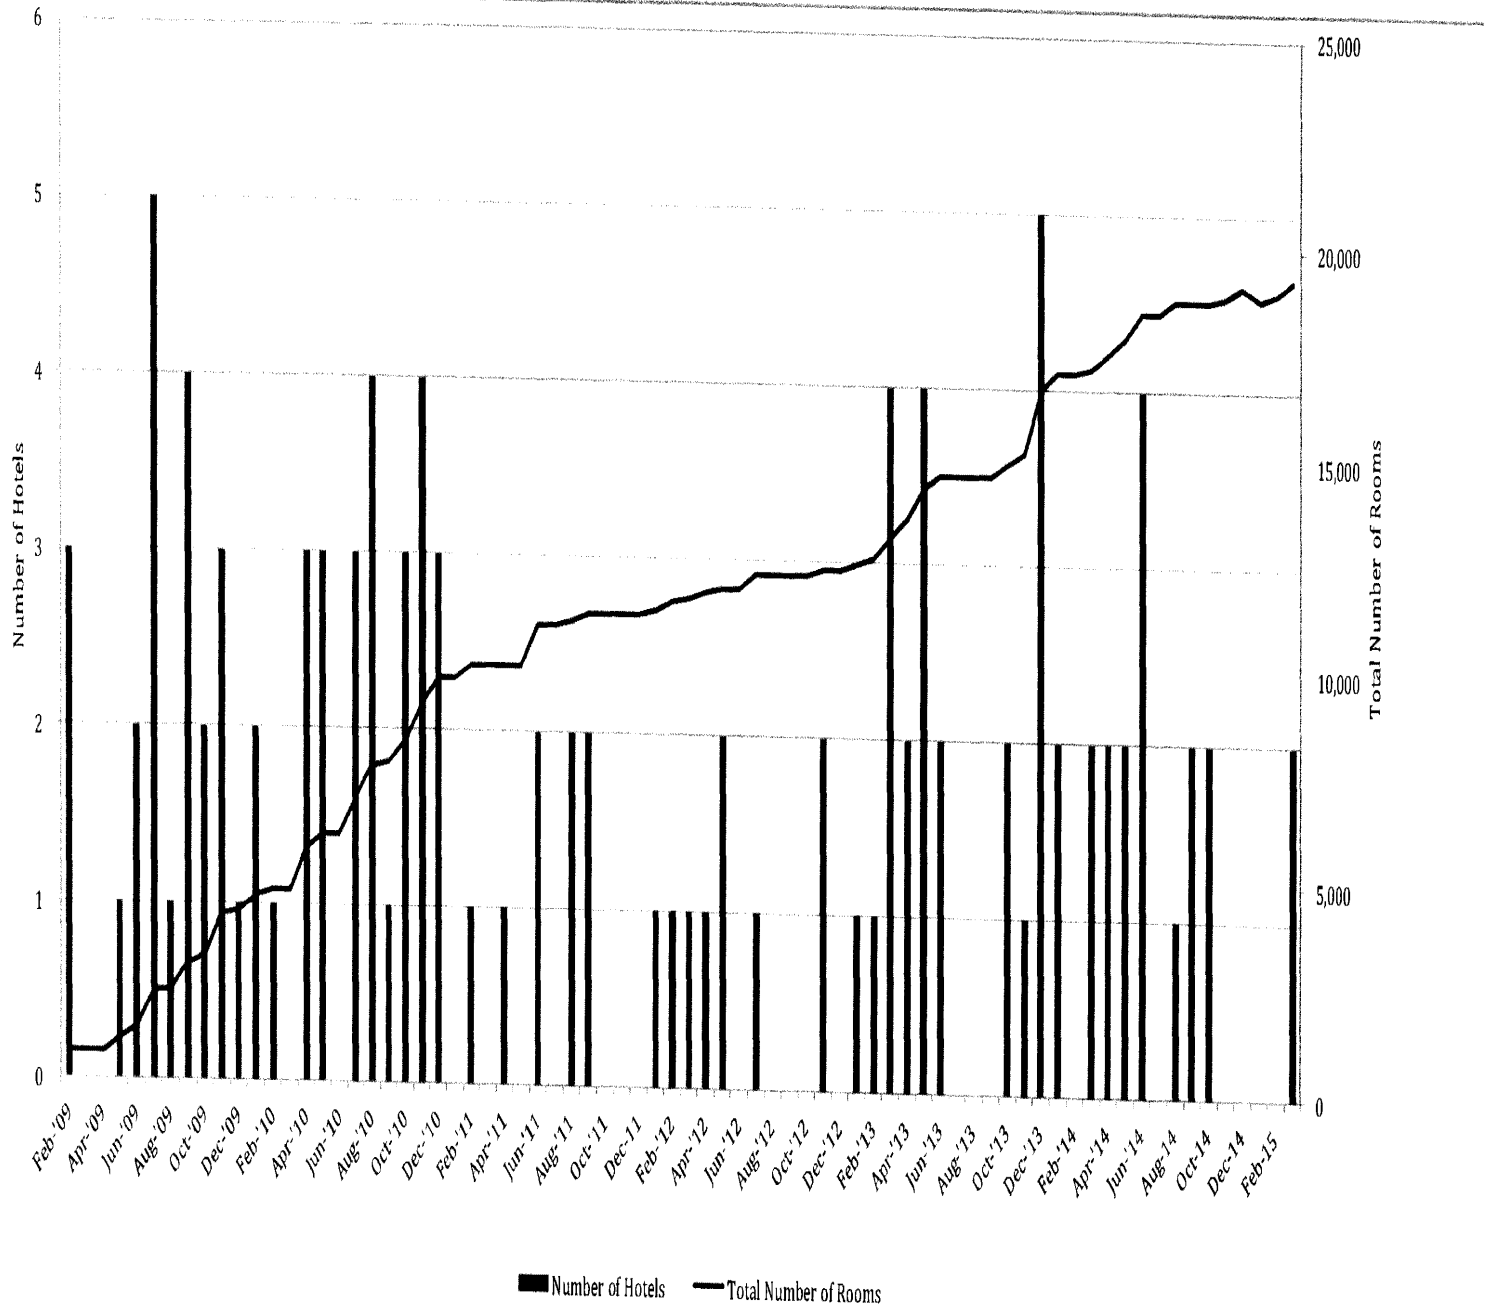
Following the early 1990s recession, RevPAR in Manhattan went from peak to trough within 27 months, returning to its former peak after approximately four years. RevPAR suffered far more severe falls as a result of the subsequent recessions. RevPAR reached bottom in 20 months and took four years and nine months to regain its former peak in the early 2000s. RevPAR took only 16 months to fall to a low of $189.34 in January 2010, and has yet to regain its prior peak. In both cases, RevPAR for Manhattan hotels dropped approximately 30% in less than two years.

RevPAR in Manhattan rebounded strongly through the end of 2010; however, the market subsequently suffered inclement weather, which impeded visitation, and an influx of new supply. RevPAR remained relatively flat in the first three months of 2011, growing moderately through the rest of the year. This moderate pace of growth has on the whole continued through March 2015, with occasional dips into monthly RevPAR stagnation or decline. RevPAR flattened out in the first quarter of this year, as supply increases continue to affect the ability of existing properties to command average rate growth. Over the last twelve months, RevPAR increased by a moderate 2.2%. As of March 2015, RevPAR was 6.3% lower than the September 2008 peak. HVS expects Manhattan's RevPAR will return to its previous peak gradually, as the market labors to manage supply growth and accelerate average rate gains. Given recent historical trends, we do not forecast a full RevPAR recovery until April 2016, which would mark a total span of seven years and seven months.

New Supply

A total of 107 new hotels opened in Manhattan between January 2009 and March 2015, adding 19,299 rooms to the market and representing growth of roughly 96.7% over the February 2009 level. Approximately 54.9% of the new supply entered the market between February 2009 and December 2011, representing the largest increase in supply over the last 27 years. The following chart lists the timing of these openings, as well as the total number of new rooms.

FIGURE 6-9 NEW SUPPLY – JANUARY 2009 TO MARCH 2015



Source: HVS and STR

The entrance of the new supply coincided with the latest recession, continuing in its wake and into the recovery of the past several years. The influx of nearly 20,000 new rooms in just six years had a minimal effect on market-wide occupancy. As previously discussed, however, supply increases in the market have historically had a stronger impact on average rate growth, and the pressure on average rates has led to the prolonged recovery of RevPAR for Manhattan hotels.

New hotel openings in Manhattan totaled 17 in 2014, as shown in the following table.

NEW SUPPLY – 2014

Hilton Garden Inn Central Park	237 West 54th Street	401	Jan-14

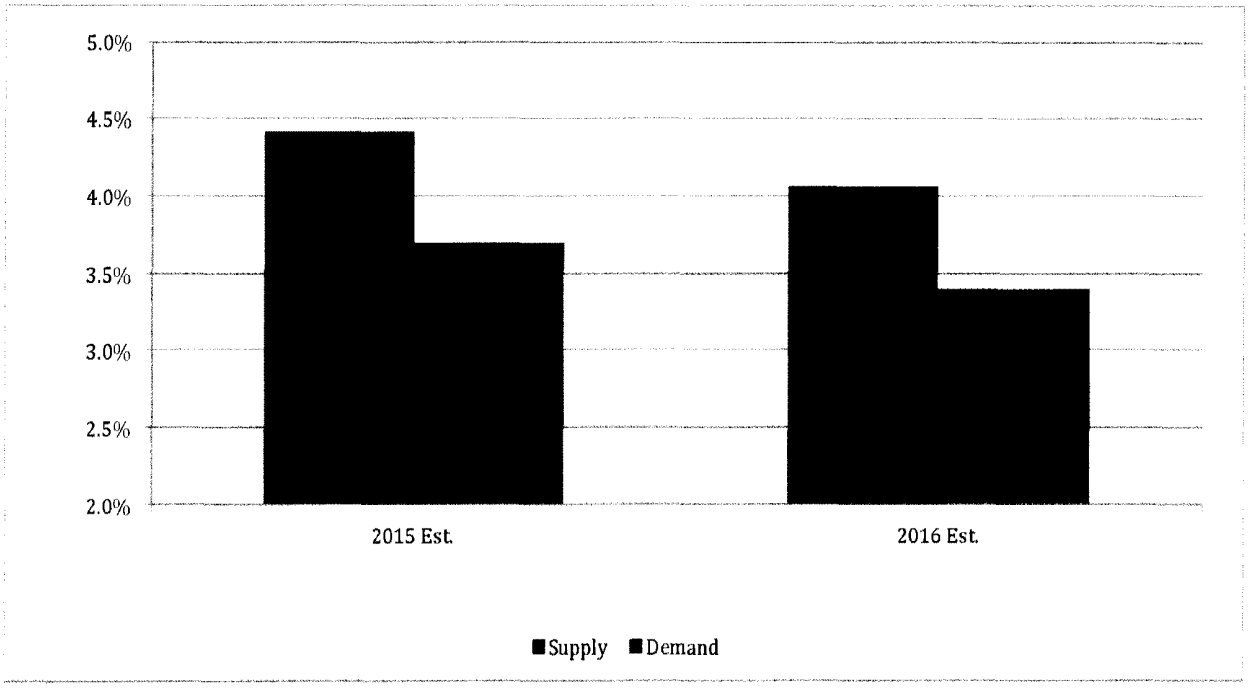
Manhattan Forecast The following chart illustrates a forecasted rise in supply and demand in Manhattan over the next two years.

FIGURE 6-10 FORECAST OF SUPPLY AND DEMAND



Source: HVS

Hotel demand is forecast to be outpaced by growth in supply in Manhattan through 2016. Approximately 3,500 rooms are slated to open in Manhattan in 2015, and more than 30% of that inventory arrived in the first quarter of the year—a historically slower season for hotel demand in the area. Based on current construction timelines, another 30% of the total 2015 pipeline is scheduled to enter in the second quarter of the year. Given such a significant upward shift in the amount of hotel inventory through the first half of 2015, occupancy levels in the market will face substantial pressure this year. HVS anticipates annual growth in hotel supply to marginally outpace that of demand, resulting in slight occupancy losses across the market. We expect this trend to extend through 2016, as new supply continues to come online.

Based on an analysis of the historical data and a review of the new supply, we have prepared the following forecast for the Manhattan lodging market through 2016.

FIGURE 7-2 MONTHLY OCCUPANCY, AVERAGE RATE, AND REVPAR TRENDS

Source: Smith Travel Research

It is important to note some limitations of the STR data. Hotels are occasionally added to or removed from the sample, and not every property reports data in a consistent and timely manner; these factors can influence the overall quality of the information by skewing the results. These inconsistencies may also cause the STR data to differ from the results of our competitive survey. Nonetheless, STR data provide the best indication of aggregate growth or decline in existing supply and demand; thus, these trends have been considered in our analysis. Opening dates, as available, are presented for each reporting hotel in the previous table.

Demand generated by the nearby LaGuardia Airport, as well as local employers and the various attractions located throughout Queens represent the primary sources of demand for the subject lodging market. As illustrated by the preceding trends, the competitive set has recorded high occupancy levels in excess of 80.0% since 2010.

Lodging supply in the LaGuardia Airport market has witnessed two supply increases during the historical period reviewed - the opening of the 220-room Hampton Inn in September of 2009 and the 173-room SpringHill Suites in December of 2012. The subject market was heavily impacted from the latest economic downturn in 2009; as a result, occupancy declined to 75.7% - the lowest level recorded. Average rate also sustained hefty decreases from its pre-recession level. The subject market quickly rebounded in 2010 and demand more than kept pace with the increase in supply. Therefore, marketwide occupancy returned to the 80% range, increasing to 85.1% over the next three years. As illustrated by monthly trends, a significant portion of the growth in 2012 and 2013 was attributable to Hurricane Sandy, as stranded travelers and local residents who were affected by Hurricane Sandy, as well as temporary workforce sought accommodation at various hotels in the area. This non-recurring demand remained in the market through the first quarter of 2013. The minor decline in 2014 reflects an adjustment from the inflated demand level in the prior year.

Average rate in the submarket increased from approximately $138 in 2009 to $163 in 2013. Similar to occupancy trends, average rate was also boosted by Hurricane Sandy related demand in 2012/13, hence the minor adjustment in 2014. The year-to-date data indicates that rate growth has resumed in the LaGuardia market.

SUPPLY

Based on an evaluation of the occupancy, rate structure, market orientation, chain affiliation, location, facilities, amenities, reputation, and quality of each area hotel, as well as the comments of management representatives, we have identified several properties that are expected to be primarily competitive with the proposed subject hotel.

The following table summarizes the important operating characteristics of the future competitors. This information was compiled from personal interviews, inspections, lodging directories, and our in-house library of operating data. The table also sets forth each property's penetration factors; penetration is the ratio between a specific hotel's operating results and the corresponding data for the market. If the penetration factor is greater than 100%, the property is performing better than the market as a whole; conversely, if the penetration is less than 100%, the hotel is performing at a level below the market-wide average.

FIGURE 7-3 COMPETITORS – OPERATING PERFORMANCE

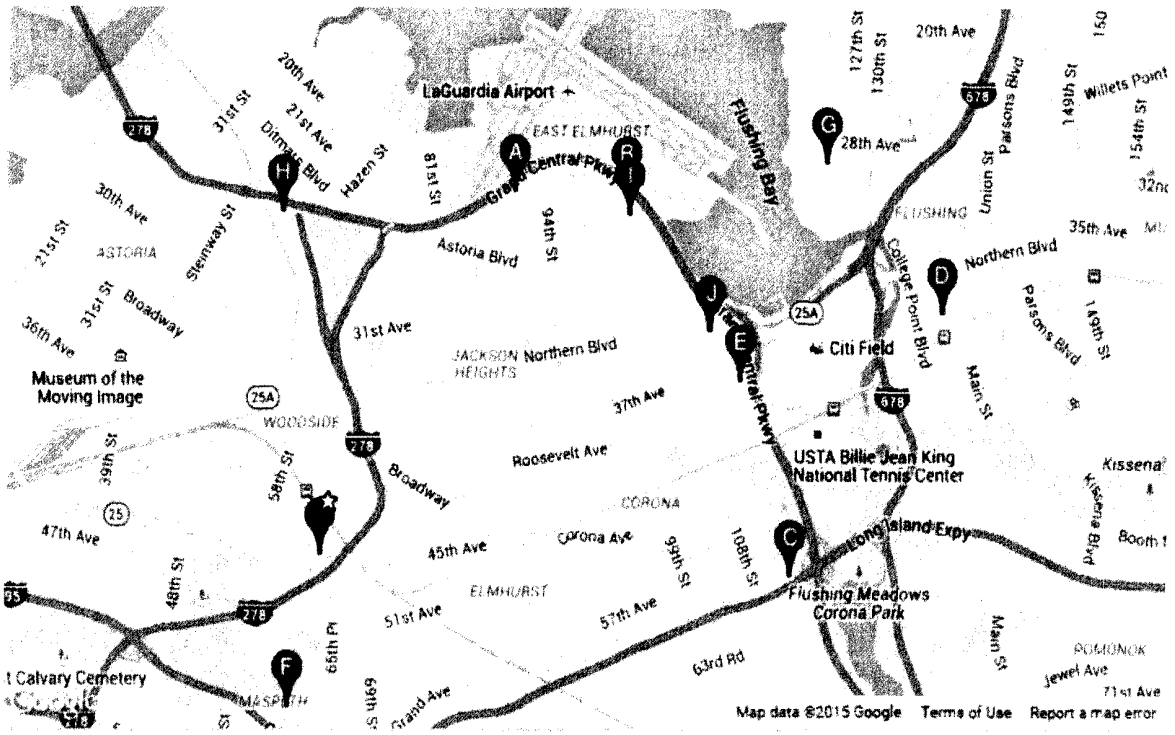
FIGURE 7-4 COMPETITOR SPECS

(b)(4)

Property	Number of Rooms	Year Opened	Meeting Space (SF)	Orientation

The following map illustrates the locations of the subject property and its future competitors.

MAP OF COMPETITION



- Proposed Holiday Inn Express Woodside
- A Courtyard by Marriott New York LaGuardia Airport
- B Marriott LaGuardia Airport
- C Holiday Inn Express LaGuardia Airport Flushing
- D Sheraton LaGuardia East Flushing
- E Holiday Inn LaGuardia Airport
- F Comfort Inn & Suites Airport Maspeth
- G Fairfield Inn by Marriott New York LaGuardia Airport
- H Fairfield Inn by Marriott New York LaGuardia Airport Astoria
- I Hampton Inn New York LaGuardia Airport
- J SpringHill Suites New York LaGuardia Airport

Supply Changes

It is important to consider any new hotels that may have an impact on the proposed subject hotel's operating performance. Based upon our research and inspection, new supply considered in our analysis is presented in the following table.

FIGURE 7-5 NEW SUPPLY

Proposed Property	Number of Rooms	Address/Location	Estimated Opening Date
Proposed Holiday Inn Express & Suites Woodside	135	64-06 Queens Boulevard	March 1, 2018
Proposed aloft LaGuardia Airport	148	100-15 Ditmars Boulevard	August 1, 2016
Proposed Ibis Style LaGuardia Airport	94	100-15 Ditmars Boulevard	August 1, 2016
Proposed AC Hotel LaGuardia	126	112-24 Astoria Boulevard	April 1, 2017
Totals/Averages	**503**		

Besides the subject property, a proposed aloft and Ibis Style are under construction on a site that contained the former LaGuardia Airport Hotel; this hotel closed in January 2014 and is currently being converted to two hotels. Furthermore, a proposed AC Hotel by Marriott is under development at 112-24 Astoria Boulevard in East Elmhurst. By virtue of their location and target demographics, these proposed hotels are expected to compete with the subject property upon opening. In addition to the proposed hotels above, the 83-room Holiday Inn Express LaGuardia Airport is currently under expansion; upon completion in early 2016, this hotel will feature additional 36 guestrooms.

While we have taken reasonable steps to investigate proposed hotel projects and their status, due to the nature of real estate development, it is impossible to determine with certainty every hotel that will be opened in the future, or what their marketing strategies and effect in the market will be. Depending on the outcome of current and future projects, the future operating potential of the proposed subject hotel may be positively or negatively affected. Future improvement in market conditions will raise the risk of increased competition. Our forthcoming forecast of stabilized occupancy and average rate is intended to reflect such risk.

Supply Conclusion

We have identified various properties that are expected to be competitive to some degree with the Proposed Holiday Inn Express & Suites Woodside. We have also investigated potential increases in competitive supply in this Queens submarket. The Proposed Holiday Inn Express & Suites Woodside should enter a dynamic market of varying product types and price points. Next, we will present our forecast for demand change, using the historical supply data presented as a starting point.

HVS

DEMAND

The following table presents the most recent trends for the subject hotel market as tracked by HVS. These data pertain to the competitors discussed previously in this section; performance results are estimated, rounded for the competition. In this respect, the information in the table differs from the previously presented STR data and is consistent with the supply and demand analysis developed for this report.

FIGURE 7-6 HISTORICAL MARKET TRENDS

Year	Accommodated Room Nights	% Change	Room Nights Available	% Change	Market Occupancy	Market ADR	% Change	Market RevPAR	% Change
Est. 2012	522,553	—	612,723	—	85.3 %	$160.21	—	$136.63	—
Est. 2013	572,503	9.6 %	671,235	9.5 %	85.3	163.59	2.1 %	139.52	2.1 %
Est. 2014	565,305	(1.3)	671,600	0.1	84.2	162.46	(0.7)	136.75	(2.0)

Demand Analysis Using Market Segmentation

For the purpose of demand analysis, the overall market is divided into individual segments based on the nature of travel. Based on our fieldwork, area analysis, and knowledge of the local lodging market, we estimate the 2014 distribution of accommodated-room-night demand as follows.

FIGURE 7-7 ACCOMMODATED ROOM NIGHT DEMAND

Market Segment	Marketwide Accommodated Demand	Marketwide Percentage of Total
Commercial	299,724	53 %
Meeting and Group	72,377	13
Leisure	193,203	34
Total	**565,305**	**100 %**

The market's demand mix comprises commercial demand, with this segment representing roughly 53% of the accommodated room nights in this Queens submarket. The remaining portion comprises meeting and group at 13%, with the final portion leisure in nature, reflecting 34%.

Using the distribution of accommodated hotel demand as a starting point, we will analyze the characteristics of each market segment in an effort to determine future trends in room-night demand.

Commercial Segment

Commercial demand consists mainly of individual businesspeople passing through the subject market or visiting area businesses, in addition to high-volume corporate accounts generated by local firms. Brand loyalty (particularly frequent-traveler programs), as well as location and convenience with respect to businesses and amenities, influence lodging choices in this segment. Companies typically designate hotels as "preferred" accommodations in return for more favorable rates, which are discounted in proportion to the number of room nights produced by a commercial client. Commercial demand is strongest Monday through Thursday nights, declines significantly on Friday and Saturday, and increases somewhat on Sunday night. It is relatively constant throughout the year, with marginal declines in late December and during other holiday periods.

Meeting and Group Segment

The meeting and group market includes meetings, seminars, conventions, trade association shows, and similar gatherings of ten or more people. Peak convention demand typically occurs in the spring and fall. Although there are numerous classifications within the meeting and group segment, the primary categories considered in this analysis are corporate groups, associations, and SMERFE (social, military, ethnic, religious, fraternal, and educational) groups. Corporate groups typically meet during the business week, most commonly in the spring and fall months. These groups tend to be the most profitable for hotels, as they typically pay higher rates and usually generate ancillary revenues including food and beverage and/or banquet revenue. SMERFE groups are typically price-sensitive and tend to meet on weekends and during the summer months or holiday season, when greater discounts are usually available; these groups generate limited ancillary revenues. Association demand is generally divided on a geographical basis, with national, regional, and state associations representing the most common sources. Professional associations and/or those supported by members' employers often meet on weekdays, while other associations prefer to hold events on weekends. The profile and revenue potential of associations varies depending on the group and the purpose of the meeting or event. In this LaGuardia Airport market, airline crew and other related group businesses are also included in this segment.

Leisure Segment

Leisure demand consists of individuals and families spending time in an area or passing through en route to other destinations. Travel purposes include sightseeing, recreation, or visiting friends and relatives. Leisure demand also includes room nights booked through Internet sites such as Expedia, Hotels.com, and Priceline; however, leisure may not be the purpose of the stay. This demand may also include business travelers and group and convention attendees who use these channels to take advantage of any discounts that may be available on these sites. Leisure demand is strongest Friday and Saturday nights, and all week during holiday periods and the summer months. These peak periods represent the inverse of commercial visitation trends, underscoring the stabilizing effect of

capturing weekend and summer tourist travel. Future leisure demand is related to the overall economic health of the region and the nation. Trends showing changes in state and regional unemployment and disposable personal income correlate strongly with leisure travel levels.

Conclusion

The purpose of segmenting the lodging market is to define each major type of demand, identify customer characteristics, and estimate future growth trends. Starting with an analysis of the local area, three segments were defined as representing the subject property's lodging market. Various types of economic and demographic data were then evaluated to determine their propensity to reflect changes in hotel demand. Based on this procedure, we forecast the following average annual compounded market-segment growth rates.

FIGURE 7-8 AVERAGE ANNUAL COMPOUNDED MARKET SEGMENT GROWTH RATES

	Annual Growth Rate					
Market Segment	**2015**	**2016**	**2017**	**2018**	**2019**	**2020**
Commercial	0.0 %	6.0 %	10.0 %	5.0 %	3.0 %	0.0 %
Meeting and Group	0.0	6.0	10.0	5.0	3.0	0.0
Leisure	0.0	6.0	10.0	5.0	3.0	0.0
Base Demand Growth	**0.0 %**	**6.0 %**	**10.0 %**	**5.0 %**	**3.0 %**	**0.0 %**

As demonstrated by historical trends, new supply is absorbed quickly in the LaGuardia Airport market. Going forward, we expect such trend to continue. Overall, we forecast demand to increase between 2016 and 2019, appropriately absorbing all new supply. As previously discussed, in July 2015, New York Governor Andrew Cuomo announced plans to completely overhaul the airport. The $4-billion project is expected to break ground in early 2016 with initial phases opening by 2019, followed by the completion of later phases through 2021. Given such, the long-term outlook for the LaGuardia Airport hotel market is optimistic.

Accommodated Demand and Market-wide Occupancy

Based upon a review of the market dynamics in the subject property's competitive environment, we have forecast growth rates for each market segment. Using the calculated potential demand for the market, we have determined market-wide accommodated demand based on the inherent limitations of demand fluctuations and other factors in the market area.

The following table details our projection of lodging demand growth for the subject market, including the total number of occupied room nights and any residual unaccommodated demand in the market.

FIGURE 7-9 FORECAST OF MARKET OCCUPANCY

	2015	2016	2017	2018	2019	2020

These room-night projections for the market area will be used in forecasting the proposed subject hotel's occupancy and average rate in the following chapter.

8. Projection of Occupancy and Average Rate

Along with average rate results, the occupancy levels achieved by a hotel are the foundation of the property's financial performance and market value. Most of a lodging facility's other revenue sources (such as food, beverages, other operated departments, and rentals and other income) are driven by the number of guests, and many expense levels vary with occupancy. To a certain degree, occupancy attainment can be manipulated by management. For example, hotel operators may choose to lower rates in an effort to maximize occupancy. Our forecasts reflect an operating strategy that we believe would be implemented by a typical, professional hotel management team to achieve an optimal mix of occupancy and average rate.

Penetration Rate Analysis

The subject property's forecasted market share and occupancy levels are based upon its anticipated competitive position within the market, as quantified by its penetration rate. The penetration rate is the ratio of a property's market share to its fair share. A complete discussion of the concept of penetration is presented in the addenda.

Historical Penetration Rates by Market Segment

In the following table, the penetration rates attained by the competitors are set forth for each segment for the base year.

FIGURE 8-1 HISTORICAL PENETRATION RATES

Property	Commercial	Meeting and Group	Leisure	Overall
Courtyard by Marriott New York LaGuardia Airport	118 %	82 %	92 %	105 %
Marriott LaGuardia Airport	99	148	70	95
Holiday Inn Express LaGuardia Airport Flushing	93	39	130	99
Sheraton LaGuardia East Flushing	97	161	91	103
Holiday Inn LaGuardia Airport	79	82	153	105
Comfort Inn & Suites Airport Maspeth	67	39	177	101
Fairfield Inn by Marriott New York LaGuardia Airport	105	79	103	101
Fairfield Inn by Marriott New York LaGuardia Airport Astoria	94	71	92	90
Hampton Inn New York LaGuardia Airport	108	74	83	95
SpringHill Suites New York LaGuardia Airport	111	84	109	107

The Courtyard by Marriott New York LaGuardia Airport achieved the highest penetration rate within the commercial segment. The highest penetration rate in the meeting and group segment was achieved by the Sheraton LaGuardia East Flushing, while the Comfort Inn & Suites Airport Maspeth led the market with the highest leisure penetration rate.

Forecast of Subject Property's Occupancy

Because the supply and demand balance for the competitive market is dynamic, there is a circular relationship between the penetration factors of each hotel in the market. The performance of individual new hotels has a direct effect upon the aggregate performance of the market, and consequently upon the calculated penetration factor for each hotel in each market segment. The same is true when the performance of existing hotels changes, either positively (following a refurbishment, for example) or negatively (when a poorly maintained or marketed hotel loses market share).

A hotel's penetration factor is calculated as its achieved market share of demand divided by its fair share of demand. Thus, if one hotel's penetration performance increases, thereby increasing its achieved market share, this leaves less demand available in the market for the other hotels to capture and the penetration performance of one or more of those other hotels consequently declines (other things remaining equal). This type of market share adjustment takes place every time there is a change in supply, or a change in the relative penetration performance of one or more hotels in the competitive market.

Our projections of penetration, demand capture, and occupancy performance for the subject property account for these types of adjustments to market share within the defined competitive market. Consequently, the actual penetration factors applicable to the subject property and its competitors for each market segment in each projection year may vary somewhat from the penetration factors delineated in the previous tables.

These positioned segment penetration rates result in the following market segmentation forecast.

FIGURE 8-2 MARKET SEGMENTATION FORECAST – SUBJECT PROPERTY

	2018	2019	2020	2021	2022
Commercial	50 %	48 %	48 %	48 %	48 %

(b)(4)

The subject property is expected to feature an attractive, limited-service product with over 40 one-bedroom suites. This product type will appeal to family travelers, as well as airline crew. Given the subject site's easy access to public transportation system, it is also expected to accommodate leisure travelers visiting Manhattan. Given such, we expect the subject property to outperform its competitors in the leisure and group segments. Based on our analysis of the proposed subject hotel and market area, we have selected a stabilized occupancy level of 86%. The stabilized occupancy is intended to reflect the anticipated results of the property over its remaining economic life, given all changes in the life cycle of the hotel. Thus, the stabilized occupancy excludes from consideration any abnormal

relationship between supply and demand, as well as any nonrecurring conditions that may result in unusually high or low occupancies. Although the subject property may operate at occupancies above this stabilized level, we believe it equally possible for new competition and temporary economic downturns to force the occupancy below this selected point of stability.

Average Rate Analysis

One of the most important considerations in estimating the value of a lodging facility is a supportable forecast of its attainable average rate, which is more formally defined as the average rate per occupied room. Average rate can be calculated by dividing the total rooms revenue achieved during a specified period by the number of rooms sold during the same period. The projected average rate and the anticipated occupancy percentage are used to forecast rooms revenue, which in turn provides the basis for estimating most other income and expense categories.

Competitive Position

Although the average rate analysis presented here follows the occupancy projection, these two statistics are highly correlated; in reality, one cannot project occupancy without making specific assumptions regarding average rate. This relationship is best illustrated by revenue per available room (RevPAR), which reflects a property's ability to maximize rooms revenue. The following table summarizes the historical average rate and the RevPAR of the subject property's future primary competitors.

FIGURE 8-4 BASE-YEAR AVERAGE RATE AND REVPAR OF THE COMPETITORS

Property	(b)(4)	Estimated 2014 Average Room Rate	Average Room Rate Penetration	Rooms Revenue Per Available Room (RevPAR)	RevPAR Penetration

The defined competitive market realized an overall average rate of $162.46 in the 2014 base year, declining from the 2013 level of $163.59. The Marriott LaGuardia and Sheraton LaGuardia East achieved the highest estimated average rates in the local competitive market by virtue of their full-service product. The Courtyard LaGuardia and Hampton Inn also achieved above-market average rates due to their airport location and strong brand affiliations. The remaining properties are not located within the immediate airport area.

(b)(4)

Marketwide Average Rate Forecast

In the year-to-date period, average rate for the subject market increased by 0.9%; considering this data and seasonality factors, we expect average rate growth to reach 2.0% by year-end. Going forward, as occupancy is expected to remain heightened, average rate is projected to increase by 2.5% in 2015, accelerating to 3.5% each in 2017 and 2018 as new supply aggressively establish their presence in the market. Beginning in 2019, average rate is projected to increase at the underlying rate of inflation (3.0%).

Subject Property Average Rate Positioning and Forecast

The proposed 135-room subject property is a limited-service hotel featuring complimentary breakfast, fitness center, business center, market pantry, and an outdoor terrace. When compared to the other hotels in the competitive set, the proposed subject hotel is located relatively far from the airport - approximately four miles southwest of the airport and a ten-minute drive under normal traffic condition. Nevertheless, over 40 of the proposed subject hotels' guestrooms will feature suite-style rooms, including fully equipped kitchens. These suites will appeal to family travelers, airline crew, and extended-stay guests. In addition, the

subject site offers convenient access to Manhattan via the public transportation system, and is therefore expected to attract leisure travelers visiting Manhattan. Considering the proposed hotel's product-type and location, we have positioned the proposed Holiday Inn Express at $150.00 in the base year (2014). This rate positioning is comparable with the other limited-service hotels that are not located within the immediate airport area. For instance, the Holiday Inn Express LaGuardia achieved an average rate of $154 in the base year, benefitting from its small room inventory and proximity to major tourist attractions in Queens - Citi Field and USTA Billie Jean King National Tennis Center. The Fairfield Inn LaGuardia Airport and Fairfield Inn Astoria both achieved average rates in the $150 range by virtue of their strong brand affiliation. The positioned average rate results in an average rate penetration of 92.3%, which is appropriate given the hotel's limited-service profile and location. Thereafter, average rate for the proposed hotel is forecast to change in tandem with the growth rates previously forecast for the overall competitive market.

The following occupancies and average rates will be used to project the subject property's rooms revenue; this forecast reflects years beginning on March 1, 2018, which correspond with our financial projections.

9. Highest and Best Use

The concept of highest and best use is a fundamental element in the determination of value of real property, either as if vacant or as improved. Highest and best use is defined as follows:

> The reasonably probable and legal use of vacant land or an improved property that is physically possible, appropriately supported, financially feasible, and that results in the highest value. The four criteria the highest and best use must meet are legal permissibility, physical possibility, financial feasibility, and maximum productivity. Alternatively, the probable use of land or improved property—specific with respect to the user and timing of the use—that is adequately supported and results in the highest present value.[12]

The concept of highest and best use is the premise upon which value is based and is a product of competitive forces in the marketplace. The principle of balance holds that real property value is created and sustained when contrasting, opposing, or interacting elements are in a state of equilibrium. This principle applies to relationships among various property components as well as the relationship between the costs of production and the property's productivity. The point of economic balance is achieved when the combination of land and building is optimal (i.e., when no marginal benefit or utility is achieved by adding another unit of capital). The law of increasing returns holds that larger amounts of the agents of production produce greater net income up to a certain point, after which the law of diminishing returns is applied.

As if Vacant

Land value is derived from potential use rather than actual use. The highest and best use is that which generates the greatest return to the land. An analysis as to the highest and best use of the land should be made first and may be influenced by many factors. In estimating highest and best use, there are four stages of analysis:

1. Legally permissible use. What uses are permitted by zoning, deed restrictions, lease encumbrances, or any other legally binding codes, restrictions, or interests?

[12] Appraisal Institute. The Dictionary of Real Estate Appraisal, 5th ed. (Chicago: Appraisal Institute, 2010).

As detailed in the zoning section of this report, the subject site is located in a commercially zoned district that allows for hotel, office, and retail uses, among other uses.

2. Physically possible use. What uses of the site are physically possible?

   The subject site is large enough to support most smaller-scale commercial developments, certainly a hotel, office, or strip retail development, as defined under the permitted legal uses. The topography is appropriate and access is adequate for these types of developments.

3. Financially feasible use. Which possible and permissible uses will produce a net return to the owner of the site?

   Given the attributes of the site, uses that would be financially feasible include retail and hotel.

4. Maximally productive use. Among the feasible uses, which use will produce the highest net return or the highest present worth?

   Given the attributes of the site and the multi-story capability of hotel use, the maximally productive use would be for a hotel.

As if Vacant Conclusion

In consideration of the foregoing factors influencing development in the immediate area, it is our opinion that the highest and best use of the subject site, as if vacant, would be for the development of a limited-service lodging facility.

Ideal Improvement

The ideal improvement for the subject site is a limited-service lodging facility that offers the appropriate amenities to operate competitively in this market.

As Improved

After determining the highest and best use of the land and the ideal improvement, an analysis should be made regarding the differences between the current improvements and the ideal improvement. These differences then form the basis for estimating deterioration and obsolescence in this report.

It is our opinion that the subject improvements be constructed in order to allow the site to conform to its ideal improvement.

10. Approaches to Value

In appraising real estate for market value, three approaches to value are considered: income capitalization, cost, and sales comparison. Basic summaries of each approach are provided as follows; please refer to the introduction of each respective chapter for additional description.

Income Capitalization Approach

The income capitalization approach analyzes a property's ability to generate financial returns as an investment. The appraisal estimates a property's operating cash flow, and the result is utilized in a direct capitalization technique and a discounted-cash-flow analysis. The income capitalization approach is often selected as the preferred valuation method for operating properties because it most closely reflects the investment rationale of knowledgeable buyers.

Sales Comparison Approach

The sales comparison approach estimates the value of a property by comparing it to similar properties sold on the open market. To obtain a supportable estimate of value, the sales price of a comparable property must be adjusted to reflect any dissimilarity between it and the property being appraised. The sales comparison approach is most useful in the case of simple forms of real estate such as vacant land and single-family homes, where the properties are homogeneous and the adjustments are few and relatively simple to compute. In the case of complex investments such as hotels, where the adjustments are numerous and more difficult to quantify, the sales comparison approach loses much of its reliability.

Cost Approach

The cost approach estimates market value by computing the current cost of replacing the property and subtracting any depreciation resulting from deterioration and obsolescence. The value of the land is then added to the depreciated value.

The cost approach is most reliable for estimating the value of new properties; therefore, this approach is particularly applicable for this project given its proposed nature.

Reconciliation

The final step in the valuation process is the reconciliation and correlation of the value indications. Factors that are considered in assessing the reliability of each approach include the purpose of the appraisal, the nature of the subject property, and the reliability of the data used. In the reconciliation, the applicability and supportability of each approach are considered and the range of value indications is examined. The most significant weight is given to the approach that produces the most reliable solution and most closely reflects the criteria used by typical

investors. Moreover, given the proposed nature of this project, the cost approach is also highly applicable.

HVS

11. Income Capitalization Approach

The income capitalization approach is based on the principle that the value of a property is indicated by its net return, or what is known as the present worth of future benefits. The future benefits of income-producing properties, such as hotels, are net income before debt service and depreciation (as estimated by a forecast of income and expense) and any anticipated reversionary proceeds from a sale. These future benefits can be converted into an indication of market value through a capitalization process and discounted cash flow analysis.

Methodology

Using the income capitalization approach, the proposed subject hotel has been valued by analyzing the local market for transient accommodations, examining future competition, and developing a forecast of income and expense that reflects anticipated income trends and cost components through a stabilized year of operation.

The forecast of income and expense is expressed in current dollars for each year. The stabilized year is intended to reflect the anticipated operating results of the property over its remaining economic life, given any or all applicable stages of build-up, plateau, and decline in the life cycle of the hotel. Thus, income and expense estimates from the stabilized year forward exclude from consideration any abnormal relationship between supply and demand, as well as any nonrecurring conditions that may result in unusual revenues or expenses. The stabilized year's net income is then extended into an eleven-year forecast of income and expense by applying the assumed underlying inflation rate to each revenue and expense item from the stabilized year forward, unless otherwise noted.

The eleven-year forecast of net income forms the basis of a mortgage-equity and discounted-cash-flow analysis, where ten years of net income and a reversion derived from the capitalized eleventh year's net income are discounted back to the date of value and summed to derive an estimate of market value. The ten-year period reflects the typical holding period of large real estate assets such as hotels. In addition, the ten-year period provides for the stabilization of income streams and comparison of yields with alternate types of real estate. The forecasted income streams reflect the future benefits of owning specific rights in income-producing real estate.

Because the value is unknown but the loan-to-value ratio and market rates of return can be estimated, the value is computed by way of a linear algebraic equation. The algebraic equation that solves for the total property value using a ten-year mortgage-equity technique was developed by Suzanne R. Mellen, CRE, MAI, FRICS, ISHC, Senior Managing Director of the San Francisco office of HVS. A complete discussion of the technique is presented in her article entitled "Simultaneous Valuation: A New Technique."[13]

Comparable Operating Statements

In order to project future income and expense for the Proposed Holiday Inn Express & Suites Woodside, we have included a sample of individual comparable operating statements from our database of hotel statistics. All financial data are presented according to the three most common measures of industry performance: ratio to sales (RTS), amounts per available room (PAR), and amounts per occupied room night (POR). These historical income and expense statements will be used as benchmarks in our forthcoming forecast of income and expense.

Fixed and Variable Component Analysis

HVS uses a fixed and variable component model to project a lodging facility's revenue and expense levels. This model is based on the premise that hotel revenues and expenses have one component that is fixed and another that varies directly with occupancy and facility usage. A projection can be made by taking a known level of revenue or expense and calculating its fixed and variable components. The fixed component is then increased in tandem with the underlying rate of inflation, while the variable component is adjusted for a specific measure of volume such as total revenue.

The actual forecast is derived by adjusting each year's revenue and expense by the amount fixed (the fixed expense multiplied by the inflated base-year amount) plus the variable amount (the variable expense multiplied by the inflated base-year amount) multiplied by the ratio of the projection year's occupancy to the base-year occupancy (in the case of departmental revenue and expense) or the ratio of the projection year's revenue to the base year's revenue (in the case of undistributed

operating expenses). Fixed expenses remain fixed, increasing only with inflation. Our discussion of the revenue and expense forecast in this report is based upon the output derived from the fixed and variable model. This forecast of revenue and expense is accomplished through a systematic approach, following the format of the *Uniform System of Accounts for the Lodging Industry*. Each category of revenue and expense is estimated separately and combined at the end in the final statement of income and expense.

Inflation Assumption

A general rate of inflation must be established that will be applied to most revenue and expense categories. The following table shows inflation estimates made by economists at some noted institutions and corporations.

FIGURE 11-4 INFLATION ESTIMATES

Source: wsj.com, January 7, 2015

As the preceding table indicates, the financial analysts who were surveyed in June 2015 anticipated inflation rates ranging from -0.1% to 2.8% (on an annualized basis) for December 2015; the average of these data points was 1.1%. The same group expects annualized inflation rates of 1.9% and 2.1% for June 2016 and December 2016, respectively, slightly lower than the inflation rate forecasts for June 2017, which average 2.2%.

As a further check on these inflation projections, we have reviewed historical increases in the Consumer Price Index (CPI-U). Because the value of real estate is predicated on cash flows over a relatively long period, inflation should be considered from a long-term perspective.

FIGURE 11-5 NATIONAL CONSUMER PRICE INDEX (ALL URBAN CONSUMERS)

Year	National Consumer Price Index	Percent Change from Previous Year
2004	188.9	—
2005	195.3	3.4 %

2007	207.3	2.8
2008	215.3	3.8
2009	214.5	-0.4
2010	218.1	1.6
2011	224.9	3.1
2012	229.6	2.1
2013	233.0	1.5
2014	234.8	0.8
Average Annual Compounded Change		
2004 - 2014:		2.2 %
2009 - 2014:		1.8

Source: Bureau of Labor Statistics

Between 2004 and 2014, the national CPI increased at an average annual compounded rate of 2.2%; from 2009 to 2014, the CPI rose by a slightly lower average annual compounded rate of 1.8%. In 2014, the CPI rose by 0.8%, a decrease from the level of 1.5% recorded in 2013.

In consideration of the most recent trends, the projections set forth previously, and our assessment of probable property appreciation levels, we have applied underlying inflation rates of 3.0%, 3.0%, and 3.0% thereafter for each respective year following the base year of 2014. This stabilized inflation rate takes into account normal, recurring inflation cycles. Inflation is likely to fluctuate above and

below this level during the projection period. Any exceptions to the application of the assumed underlying inflation rate are discussed in our write-up of individual income and expense items.

Base-Year Statement of Income and Expense

Based on our review of the operating statements of comparable properties, we have formulated a base-year statement of income and expense for the proposed subject property, expressed in 2014 dollars. The base-year statement, which is set forth in the following table, will be used to determine the relationship between the fixed and variable components.

Summary of Projections

Based on an analysis that will be detailed throughout this section, we have formulated a forecast of income and expense. The following table presents a detailed forecast through the fifth projection year, including amounts per available room and per occupied room. The second table illustrates our ten-year forecast of income and expense, presented with a lesser degree of detail. The forecasts pertain to years that begin on March 1, 2018, expressed in inflated dollars for each year.

Forecast of Income and Expense

The following description sets forth the basis for the forecast of income and expense. We anticipate that it will take three years for the subject property to reach a stabilized level of operation. Each revenue and expense item has been forecast based upon our review of the subject property's operating budget and comparable income and expense statements. The forecast is based upon fiscal years beginning March 1, 2018, expressed in inflated dollars for each year.

Rooms Revenue

Rooms revenue is determined by two variables: occupancy and average rate. We projected occupancy and average rate in a previous section of this report. The proposed subject hotel is expected to stabilize at an occupancy level of 86% with an average rate of $179.09 in 2020/21. Following the stabilized year, the subject property's average rate is projected to increase along with the underlying rate of inflation.

Miscellaneous Revenue

The proposed subject hotel's miscellaneous income comprises of telephone charges and other miscellaneous guest services and commissions. In the base year, net other revenue for the proposed subject property is projected at $1.00 per occupied room, net of expenses, based on the operating statement of the most appropriate comparable property. Changes in this revenue item through the projection period result from the application of the underlying inflation rate and projected changes in occupancy.

Rooms Expense

Rooms expense consists of items related to the sale and upkeep of guestrooms and public space. Salaries, wages, and employee benefits account for a substantial portion of this category. Although payroll varies somewhat with occupancy and managers can generally scale the level of service staff on hand to meet an expected occupancy level, much of a hotel's payroll is fixed. A base level of front desk personnel, housekeepers, and supervisors must be maintained at all times. As a result, salaries, wages, and employee benefits are only moderately sensitive to changes in occupancy.

Commissions and reservations are usually based on room sales, and thus are highly sensitive to changes in occupancy and average rate. While guest supplies vary 100% with occupancy, linens and other operating expenses are only slightly affected by volume.

In the base year, the proposed hotel's rooms expense has been projected at $39.00 per occupied room, based on the operating statements of comparable properties. Changes in this expense item through the projection period result from the application of the underlying inflation rate and projected changes in occupancy.

Administrative and General Expense

Administrative and general expense includes the salaries and wages of all administrative personnel who are not directly associated with a particular department. Expense items related to the management and operation of the property are also allocated to this category.

Most administrative and general expenses are relatively fixed. The exceptions are cash overages and shortages; commissions on credit card charges; provision for doubtful accounts, which are moderately affected by the number of transactions or total revenue; and salaries, wages, and benefits, which are very slightly influenced by volume. (b)(4)

In the base year, administrative and general expense for the proposed subject property is projected at [redacted] per available room, based on the operating statement of the most appropriate comparable property. Changes in this expense item through the projection period result from the application of the underlying inflation rate and projected changes in occupancy.

Marketing Expense

Marketing expense consists of all costs associated with advertising, sales, and promotion; these activities are intended to attract and retain customers. Marketing can be used to create an image, develop customer awareness, and stimulate patronage of a property's various facilities.

The marketing category is unique in that all expense items, with the exception of fees and commissions, are totally controlled by management. Most hotel operators establish an annual marketing budget that sets forth all planned expenditures. If the budget is followed, total marketing expenses can be projected accurately.

Marketing expenditures are unusual because although there is a lag period before results are realized, the benefits are often extended over a long period. Depending on the type and scope of the advertising and promotion program implemented, the lag time can be as short as a few weeks or as long as several years. However, the favorable results of an effective marketing campaign tend to linger, and a property often enjoys the benefits of concentrated sales efforts for many months.

(b)(4)

In the base year, marketing expense for the proposed subject property has been projected at [redacted] per available room, based on the operating statement of the most appropriate comparable property. Changes in this expense item through the projection period result from the application of the underlying inflation rate and projected changes in occupancy.

Franchise Fee

As previously discussed, the subject is expected to be franchised under the Holiday Inn Express brand. Costs associated with this franchise are summarized in the introductory chapter in this report.

Property Operations and Maintenance

Property operations and maintenance expense is another expense category that is largely controlled by management. Except for repairs that are necessary to keep the facility open and prevent damage (e.g., plumbing, heating, and electrical items), most maintenance can be deferred for varying lengths of time.

Maintenance is an accumulating expense. If management elects to postpone performing a required repair, they have not eliminated or saved the expenditure; they have only deferred payment until a later date. A lodging facility that operates with a lower-than-normal maintenance budget is likely to accumulate a considerable amount of deferred maintenance.

The age of a lodging facility has a strong influence on the required level of maintenance. A new or thoroughly renovated property is protected for several years by modern equipment and manufacturers' warranties. However, as a hostelry grows older, maintenance expenses escalate. A well-organized preventive maintenance system often helps delay deterioration, but most facilities face higher property operations and maintenance costs each year, regardless of the occupancy trend. The quality of initial construction can also have a direct impact on future maintenance requirements. The use of high-quality building materials and construction methods generally reduces the need for maintenance expenditures over the long term.

(b)(4)

In the base year, property operations and maintenance expense for the proposed subject property is projected at [redacted] per available room, based on the operating statement of the most appropriate comparable property. In light of the new facilities available at the proposed subject property upon opening, we have applied

(b)(4) a [redacted] discount to property operations and maintenance expense in the first three projection years. Changes in this expense item throughout the projection period result from the application of the underlying inflation rate.

Utilities Expense

The utilities consumption of a lodging facility takes several forms, including water and space heating, air conditioning, lighting, cooking fuel, and other miscellaneous power requirements. The most common sources of hotel utilities are electricity, natural gas, fuel oil, and steam. This category also includes the cost of water service.

Total energy cost depends on the source and quantity of fuel used. Electricity tends to be the most expensive source, followed by oil and gas. Although all hotels consume a sizable amount of electricity, many properties supplement their utility requirements with less expensive sources, such as gas and oil, for heating and cooking.

(b)(4)

In the base year, utilities expense for the proposed subject property has been projected at [redacted] per available room, based on the operating statement of the most appropriate comparable property. Changes in this expense item through the projection period result from the application of the underlying inflation rate and projected changes in occupancy.

Management Fee

Management expense consists of the fees paid to the managing agent contracted to operate the property. Some companies provide management services and a brand-name affiliation (first-tier management company), while others provide management services alone (second-tier management company). Some management contracts specify only a base fee (usually a percentage of total revenue), while others call for both a base fee and an incentive fee (usually a percentage of defined profit). Basic hotel management fees are often based on a percentage of total revenue, which means they have no fixed component. While base fees typically range from 2% to 4% of total revenue, incentive fees are deal specific and often are calculated as a percentage of income available after debt service and, in some cases, after a preferred return on equity. Total management fees for the proposed subject hotel have been forecast at 3.0% of total revenue.

Property Taxes

Property (or ad valorem) tax is one of the primary revenue sources of municipalities. Based on the concept that the tax burden should be distributed in proportion to the value of all properties within a taxing jurisdiction, a system of assessments is established. Theoretically, the assessed value placed on each parcel bears a definite relationship to market value, so properties with equal market values will have similar assessments, and properties with higher and lower values will have proportionately larger and smaller assessments. Depending on the taxing policy of the municipality, property taxes can be based on the value of the real property or the value of the personal property and the real property.

The taxing jurisdiction governing the subject property assesses only real property. Within the City of New York, real property taxes are levied on fiscal years that begin on July 1 and end on June 30. Land and improvements are assessed at 45% of market value for Class 4 buildings, such as lodging facilities.

Commercial properties in New York City maintain two assessed values in any given tax year: target and transitional. The use of the two assessed values was instituted as a result of the significant tax increases that occurred historically in the City of New York. The target value is that value level which a property is ultimately determined to achieve, while the transitional value phases in the difference from the original to the target value over a five-year period. For example, if a property's assessment is increased by $100,000 in one year, the target assessment would increase by $100,000, while the transitional assessment would increase by $20,000 for each of the next five years. During any taxable year,

a property is taxed on the lesser of the two assessments. It is important to note, however, that assessment increases resulting from a major renovation project or ground-up construction (such as the subject development) are not subject to a five-year phase-in.

The following details the site's assessment history.

Tax Rates

Tax rates are based on the city and county budgets, which change annually. The following table shows changes in the tax rate per $100 of assessed value from 1996/97 through 2015/16.

FIGURE 11-10 HISTORICAL TAX RATES

Year	Tax Rate per $100 of Assessment	Percent Change from Previous Year
1996/97	$10.252	–
1997/98	10.164	(0.9) %
1998/99	10.236	0.7
1999/00	9.989	(2.4)
2000/01	9.768	(2.2)
2001/02	9.712	(0.6)
2002/03	10.678	9.9
2003/04	11.431	7.1
2004/05	11.558	1.1
2005/06	11.306	(2.2)
2006/07	10.997	(2.7)
2007/08	10.059	(8.5)
2008/09	10.241	1.8
2009/10	10.426	1.8
2010/11	10.312	(1.1)
2011/12	10.152	(1.6)
2012/13	10.288	1.3
2013/14	10.323	0.3
2014/15	10.684	3.5
2015/16	10.656	(0.3)
Average Annual Compounded Change,		
1996/97 - 2015/16:		0.2 %
2000/01 - 2015/16:		0.6

For the purposes of our analysis, we have assumed that the tax rate will increase at an average annual compounded rate of 1.0% throughout the projection period.

ICAP Tax Abatement

The subject site is located in a "Special Area" of Queens that is expected to enable it to qualify and benefit from a property tax abatement under the Industrial and Commercial Abatement Program (ICAP). This program provides partial exemption from, or abatement of, property taxes for varying periods for eligible industrial

and commercial buildings that are built, modernized, rehabilitated, expanded, or otherwise physically improved under the ICAP geographical boundaries. Accordingly, the proposed subject property is anticipated to be exempt from any increases in assessed value resulting from construction of the hotel for a period of twenty-five years.

The hotel is expected to be only taxed on the land assessment for 16 years. Thereafter, the improvement assessment abatement will be phased-out by 10% per annum from years 17 through 25. Thus, the property tax burden will encompass the full tax assessment in year 26 of operation. For the purposes of this appraisal, we have applied upward adjustments to the target land value between 2016/17 and 2019/20 tax years, in recognition of the construction of the hotel and the ramping-up of hotel operation. Beginning in 2020/21, the target land value is forecast to increase by 2.0% per annum.

Note that the absence of such a property tax abatement or any deviation from the anticipated duration of the property tax exemption period will have a significant impact on the proposed subject hotel's estimated market value. Hence, our analysis is explicitly predicated on the extraordinary assumption that proposed subject hotel will qualify for the Industrial and Commercial (property tax) Abatement Program (ICAP) for the typical duration for a commercial project in a "special commercial area" - 25 years.

Property Tax Forecast

Based on the comparable assessment, anticipated ICAP abatement, and the tax rate information, the subject property's projected property tax expense levels are calculated as follows. We have applied upward adjustments to the land assessment in anticipation of the completion and opening of the subject property.

FIGURE 11-11 PROJECTED PROPERTY TAX EXPENSE

*Tax year begins July 1

**Projection year begins March 1

Insurance Expense

The insurance expense category consists of the cost of insuring the hotel and its contents against damage or destruction by fire, weather, sprinkler leakage, boiler explosion, plate glass breakage, and so forth. General insurance costs also include premiums relating to liability, fidelity, and theft coverage. Insurance rates are based on many factors, including building design and construction, fire detection and extinguishing equipment, fire district, distance from the firehouse, and the area's fire experience. Insurance expenses do not vary with occupancy.

Based upon the comparable data and the structural attributes of the proposed subject hotel, we project the proposed subject hotel's insurance expense at $600 per available room by the stabilized year (positioned at $500 on a per-available-room basis in base-year dollars). This forecast equates to 1.1% of total revenue on a stabilized basis. In subsequent years, this amount is assumed to increase in tandem with inflation.

Reserve for Replacement

Furniture, fixtures, and equipment are essential to the operation of a lodging facility, and their quality often influences a property's class. This category includes all non-real estate items that are capitalized, rather than expensed. The furniture, fixtures, and equipment of a hotel are exposed to heavy use and must be replaced

at regular intervals. The useful life of these items is determined by their quality, durability, and the amount of guest traffic and use.

Periodic replacement of furniture, fixtures, and equipment is essential to maintain the quality, image, and income-producing potential of a lodging facility. Because capitalized expenditures are not included in the operating statement but affect an owner's cash flow, a forecast of income and expense should reflect these expenses in the form of an appropriate reserve for replacement.

The International Society of Hospitality Consultants (ISHC) undertook a major industry-sponsored study of the capital expenditure requirements for full-service/luxury, select-service, and extended-stay hotels. The most recent findings of the study were published in a report in 2007.[14] Historical capital expenditures of well-maintained hotels were investigated through the compilation of data provided by most of the major hotel companies in the United States. A prospective analysis of future capital expenditure requirements was also performed based upon the cost to replace short- and long-lived building components over a hotel's economic life. The study showed that the capital expenditure requirements for hotels vary significantly from year to year and depend upon both the actual and effective ages of a property. The results of this study showed that hotel lenders and investors are requiring reserves for replacement ranging from 4% to 5% of total revenue.

For the purpose of this analysis, we have assumed that the hotel will be maintained in a competitive condition over its economic life. We have further assumed that the related, necessary capital expenditures will be funded by annual reserves for replacement. An amount equal to 2.0% and 3.0% of annual gross revenue have been deducted from our forecast of income and expense in the first and second projection years, respectively; thereafter, we have deducted an amount equal to 4.0% of annual gross revenue throughout our projection period, in recognition of the ongoing cost of maintaining the facilities.

INCOME CAPITALIZATION

The subject property upon completion has been valued via the income approach through the application of a ten-year mortgage-equity technique and a discounted-cash-flow analysis. The conversion of the subject property's forecasted EBITDA Less Replacement Reserve into an estimate of value was based on the premise that investors typically leverage their real estate investments to enhance their equity yield. Typically, the majority of a transaction is capitalized with mortgage financing (50% to 80%), with equity comprising the balance (20% to 50%). The

[14] The International Society of Hotel Consultants, Can$ 2007: A Study of Capital Expenditures in the U.S. Hotel Industry.

amounts and terms of available mortgage financing and the rates of return that are required to attract sufficient equity capital formed the basis for allocating the net income between the mortgage and equity components and deriving a value estimate.

Mortgage Component

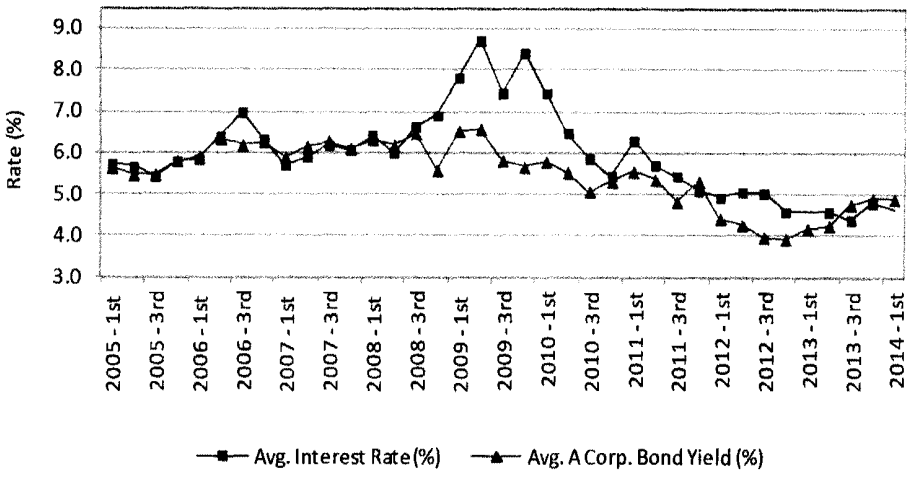
Hotel financing is currently very active at all tiers of the lodging industry. Lenders are attracted to the lodging industry because of the higher yields generated by hotel financing relative to other commercial real estate, and the industry is performing strongly, with supply growth constrained. Commercial banks, mortgage REITs, insurance companies, and CMBS and mezzanine lenders are aggressively pursuing deals. Financing is also increasingly available for hotels that require a turnaround.

Data for the mortgage component may be developed from statistics of actual hotel mortgages made by long-term lenders. The American Council of Life Insurance, which represents 20 large life insurance companies, publishes quarterly information pertaining to the hotel mortgages issued by its member companies.

Because of the six- to nine-month lag time in reporting and publishing hotel mortgage statistics, it was necessary to update this information to reflect current lending practices. Our research indicates that the greatest degree of correlation exists between the average interest rate of a hotel mortgage and the concurrent yield on an average-A corporate bond.

The following chart summarizes the average mortgage interest rates of the hotel loans made by these lenders. For the purpose of comparison, the average-A corporate bond yield (as reported by *Moody's Bond Record*) is also shown.

FIGURE 11-12 AVERAGE MORTGAGE INTEREST RATES AND AVERAGE-A CORPORATE BOND YIELDS



Sources: American Council of Life Insurance, Moody's Bond Record, HVS

The relationship between hotel interest rates and the yields from the average-A corporate bond can be detailed through a regression analysis, which is expressed as follows.

$$Y = 0.93675987\ X + 0.96975529$$

Where: Y = Estimated Hotel Mortgage Interest Rate
X = Current Average-A Corporate Bond Yield
(Coefficient of correlation is 93%)

The July 22, 2015, average yield on average-A corporate bonds, as reported by Moody's Investors Service, was 4.43%. When used in the previously presented equation, a factor of 4.43 produces an estimated hotel/motel interest rate of 5.12% (rounded).

Yields on U.S. treasuries and average-A corporate bonds remain at low levels due to Federal Reserve policy and the strengthening of the dollar, providing a very favorable financing environment. Interest rates for single hotel assets are currently ranging from 4.0% to 6.0%, depending on the type of debt, loan-to-value ratio, and the quality of the asset and its market.

In addition to the mortgage interest rate estimate derived from this regression analysis, HVS constantly monitors the terms of hotel mortgage loans made by our institutional lending clients. Fixed-rate debt is being priced at roughly 200 to 400 basis points over the corresponding yield on treasury notes. As of July 22, 2015, the yield on the ten-year T-bill was 2.31%, indicating an interest rate range from 4.3% to 6.3%. With the strengthening of the dollar, hotel mortgage interest rates have returned to their historical low. The Federal Reserve is expected to maintain rates at the current level through mid-year 2015, with a potential increase anticipated in the latter half of the year if the U.S. economy continues to perform strongly. At present, we find that lenders that are active in the market are using loan-to-value ratios of 60% to 80% and amortization periods of 20 to 30 years.

Based on our analysis of the current lodging industry mortgage market and adjustments for specific factors, such as the proposed property's location and conditions in the Queens hotel market, it is our opinion that a 5.50% interest, 25-year amortization mortgage with a 0.073690 constant is appropriate for the proposed subject hotel. In the mortgage-equity analysis, we have applied a loan-to-value ratio of 70%, which is reasonable to expect based on this interest rate and current parameters.

Equity Component

The remaining capital required for a hotel investment generally comes from the equity investor. The rate of return that an equity investor expects over a ten-year holding period is known as the equity yield. Unlike the equity dividend, which is a short-term rate of return, the equity yield specifically considers a long-term holding period (generally ten years), annual inflation- adjusted cash flows, property appreciation, mortgage amortization, and proceeds from a sale at the end of the holding period. To establish an appropriate equity yield rate, we have used two sources of data: past appraisals and investor interviews.

Hotel Sales – Each appraisal performed by HVS uses a mortgage-equity approach in which income is projected and then discounted to a current value at rates reflecting the cost of debt and equity capital. In the case of hotels that were sold near the date of our valuation, we were able to derive the equity yield rate and unlevered discount rate by inserting the ten-year projection, total investment (purchase price and estimated capital expenditure and/or PIP) and debt assumptions into a valuation model and solving for the equity yield. The overall capitalization rates for the historical income and projected first-year income are based on the sales price "as is." The following table shows a representative sample of hotels that were sold on or about the time that we appraised them, along with the derived equity return and discount rates based on the purchase price and our forecast.

FIGURE 11-13 SAMPLE OF HOTELS SOLD – BUDGET/ECONOMY

Investor Interviews - During the course of our work, we continuously monitor investor equity-yield requirements through discussions with hotel investors and brokers. While equity still looks to yield high returns for the risk of hotel investment, the low-yield environment, coupled with increased competition for quality assets, has placed downward pressure on equity-yield returns. We find that equity-yield rates currently range from a low in the low-to-mid teens for high-barrier-to-entry "trophy assets"; the upper teens for high quality, institutional-grade assets in strong markets; and the upper teens to low 20s for quality assets in more typical markets. Equity yields have increased moderately because of higher leverage levels, though competition for quality assets continues to place downward pressure on return requirements. Equity-yield rates tend to exceed 20% for aging assets with functional obsolescence and/or other challenging property- or market-related issues. Equity return requirements also vary with an investment's level of leverage. Higher loan-to-value ratios are becoming more prevalent, allowing for increased equity returns.

The following table summarizes the range of equity yields indicated by hotel sales and investor interviews. We note that there tends to be a lag between the sales data and current market conditions, and thus, the full effect of the change in the economy and capital markets may not yet be reflected.

FIGURE 11-15 SUMMARY OF EQUITY YIELD OR INTERNAL RATE OF RETURN REQUIREMENTS

Source	Data Point Range	Average
HVS Hotel Sales - Full-Service & Luxury	15.1% - 22%	18.2%
HVS Hotel Sales - Select-Service & Extended-Stay	14.3% - 21.9%	18.9%
HVS Hotel Sales - Budget/Economy	16.9% - 25.5%	21.2%
HVS Investor Interviews	12% - 22%	

Based on the assumed 70% loan-to-value ratio, the risk inherent in achieving the projected income stream, and the age, condition, and anticipated market position of the subject property, it is our opinion that an equity investor is likely to require an equity yield rate of 15.5%, reflective of the subject site's location in the New York City area. While the lack of attainable yields on alternate investments has continued to put downward pressure on equity-yield rates, increasing leverage levels are enabling investors to earn higher returns. Competition for quality assets remains strong among all hotel asset types. These influences are keeping equity yields from increasing significantly. Intense competition for assets in the major metro areas is pushing investors to pursue acquisitions with greater upside in

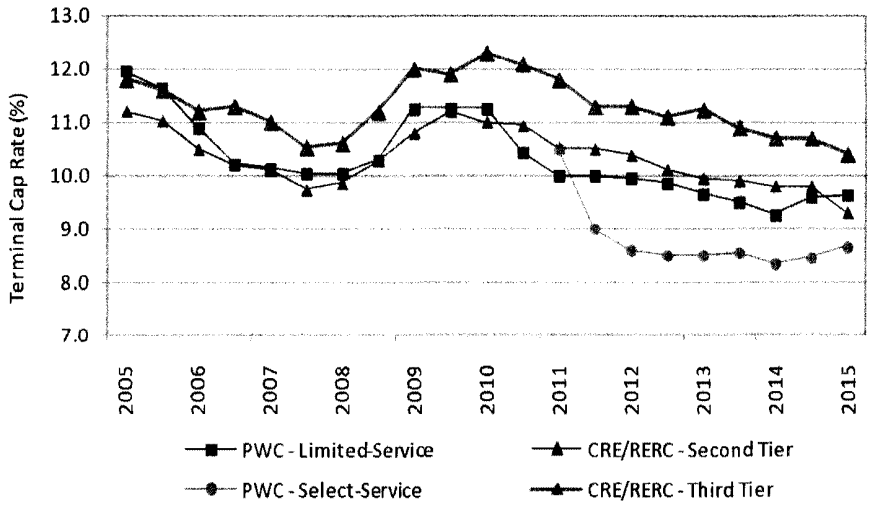
secondary and tertiary markets. Value-added acquisitions are also attracting greater interest due to the increasing availability of financing for these types of transactions and the potential for higher returns.

Terminal Capitalization Rate

Inherent in this valuation process is the assumption of a sale at the end of the ten-year holding period. The estimated reversionary sale price as of that date is calculated by capitalizing the projected eleventh-year net income by an overall terminal capitalization rate. An allocation for the selling expenses is deducted from this sale price, and the net proceeds to the equity interest (also known as the equity residual) are calculated by deducting the outstanding mortgage balance from the reversion.

We have reviewed several recent investor surveys. The following chart summarizes the averages presented for terminal capitalization rates in various investor surveys during the past decade. Note that survey data lag the market and do not necessarily reflect the most current market conditions.

FIGURE 11-16 HISTORICAL TRENDS OF TERMINAL CAPITALIZATION RATES



HVS

TABLE 11-17 TERMINAL CAPITALIZATION RATES DERIVED FROM INVESTOR SURVEYS

Source	Data Point Range	Average
PWC Real Estate Investor Survey - 1st Quarter 2015		
Limited-Service Hotels	7.75% - 11.0%	9.6%
Select-Service Hotels	6.0% - 11.0%	8.7%
USRC Hotel Investment Survey - Winter 2015		
Limited-Service Hotels	6.8% - 12.0%	9.4%
Situs RERC Real Estate Report - Spring 2015		
Second Tier Hotels	6.4% - 12.0%	9.4%
Third Tier Hotels	8.0% - 13.0%	10.5%

For purposes of this analysis, we have applied a terminal capitalization rate of 9.0%, reflective of the subject property's location in the New York City area, the proposed nature of the subject hotel, as well as the anticipated phasing-out of the assumed ICAP tax abatement. Our final position for the terminal capitalization rate reflects the current market for hotel investments. In tandem with overall lower return expectations, terminal capitalization rates for quality hotel assets in markets with high barriers to entry have returned to their 2005 to 2007 lows, while terminal capitalization rates for older assets or for those suffering from functional obsolescence and/or weak market conditions remain elevated, reflecting the market's recognition that certain assets have less opportunity for significant appreciation.

Mortgage-Equity Method – Value Opinion

The valuation of the mortgage and equity components is accomplished using an algebraic equation that calculates the exact amount of debt and equity that the hotel will be able to support based on the anticipated cash flow (as estimated by the forecast of income and expense) and the specific return requirements demanded by the mortgage lender (interest) and the equity investor (equity yield). Thus, the anticipated net income (before debt service and depreciation) is allocated to the mortgage and equity components based on market rates of return and loan-to-value ratios. The total of the mortgage component and the equity component equals the value of the property. Using this method of the income capitalization approach with the variables set forth, we estimate the value of the fee simple interest in the subject property, as of March 1, 2018, to be $36,000,000.

Mathematical Proof of Value

The value is mathematically proven by confirming that the market-derived yields are met for the lender and equity participant during the projection period. Using the assumed financial structure set forth in the previous calculations, market value can be allocated between the debt and equity as follows.

Mortgage Component (70%)	[redacted]	(b)(4)
Equity Component (30%)		
Total		

The annual debt service is calculated by multiplying the mortgage component by the mortgage constant.

Mortgage Component	[redacted]	(b)(4)
Mortgage Constant		
Annual Debt Service		

The eleven-year forecast of net income and ten-year forecast of net income to equity are presented in the following table.

FIGURE 11-18 ELEVEN-YEAR FORECAST OF NET INCOME AND TEN-YEAR FORECAST OF NET INCOME TO EQUITY

Year	Net Income Before Debt Service	Less: Debt Service	Net Income to Equity	Debt Coverage Ratio	Cash-on-Cash Return
2018/19	[redacted]				
2019/20					
2020/21					
2021/22					
2022/23					
2023/24					
2024/25					
2025/26					
2026/27					
2027/28					
2028/29					

(b)(4)

The net proceeds to equity upon sale of the property were determined by deducting sales expenses (brokerage and legal fees) and the outstanding mortgage balance.

The equity residual at the end of the tenth year is calculated by deducting brokerage and legal fees and the mortgage balance from the reversionary value. The reversionary value is calculated as the eleventh year's net income capitalized by the terminal capitalization rate. The calculation is shown as follows.

11th Year's Net Income	
Capitalization Rate	
Reversionary Value	
Less:	
Brokerage and Legal Fees	
Mortgage Balance	
Net Sale Proceeds to Equity	

(b)(4)

The discount rate (before debt service), the yield to the lender, and the yield to the equity position have been calculated by computer with the following results.

FIGURE 11-19 TOTAL PROPERTY VALUE AND INTERNAL RATES OF RETURN

Position	Value	Projected Yield (Internal Rate of Return) Over Holding Period
Total Property		
Mortgage		
Equity		

(b)(4)

Note: Whereas the mortgage constant and value are calculated on the basis of monthly mortgage payments, the mortgage yield in this proof assumes single annual payments. As a result, the proof's derived yield may be slightly less than that actually input.

The position of the total property yield or unlevered discount rate reflects the current ready availability and low cost of both debt and equity capital. Since the third quarter of 2013, lenders have been very active, with capital available from numerous sources. Equity and mezzanine financing is also readily available due to the attractive yields being generated by hotels when compared with other forms of commercial real estate. We continue to interview hotel investors to assess the movement in yield rates and their impact on value.

The following tables demonstrate that the property receives its anticipated yields, proving that the value is correct based on the assumptions used in this approach.

Direct Capitalization

The following chart summarizes the averages presented for overall capitalization rates in various investor surveys during the past decade.

FIGURE 11-22 HISTORICAL TRENDS OF OVERALL CAPITALIZATION RATES

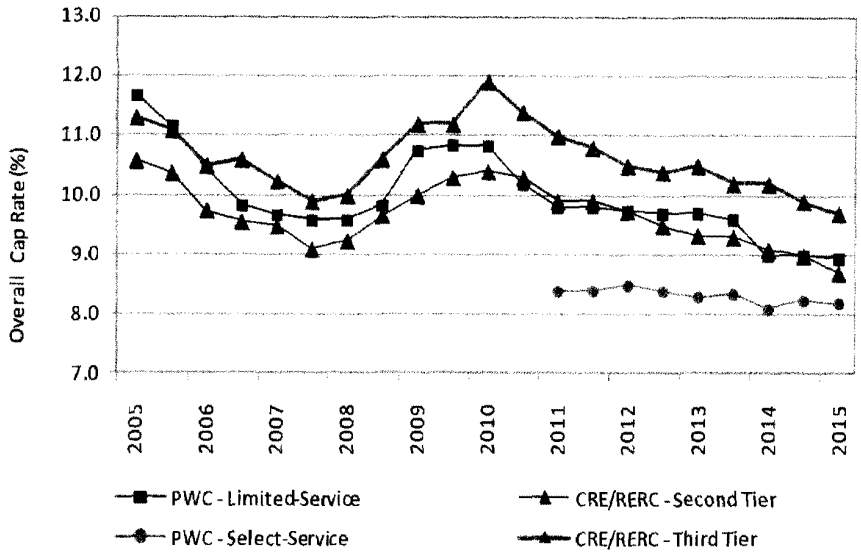

FIGURE 11-23 OVERALL CAPITALIZATION RATES DERIVED FROM SALES AND INVESTOR SURVEYS

Source	Data Point Range	Average
HVS Hotel Sales - Budget/Economy	0.7% - 14.6%	8.0%
HVS Hotel Sales - Select-Service & Extended-Stay	3.4% - 20%	7.9%
PWC Real Estate Investor Survey - 1st Quarter 2015		
Limited-Service Hotels	7.5% - 10.0%	9.0%
Select-Service Hotels	5.0% - 11.0%	8.2%
USRC Hotel Investment Survey - Winter 2015		
Limited-Service Hotels	6.3% - 10.0%	8.5%
Situs RERC Real Estate Report - Spring 2015		
Second Tier Hotels	5.6% - 11.0%	8.7%
Third Tier Hotels	7.0% - 12.5%	9.7%

We note that the averages illustrated in the previous table are derived from wide arrays of data points, and a range of reasonableness extends both lower and higher than the indicated data points. The following table reflects the capitalization rates for the proposed subject hotel that have been derived based on our estimate of

market value via the discounted-cash-flow analysis. Note that the stabilized year's net income has been deflated to first-year dollars.

FIGURE 11-24 DERIVED CAPITALIZATION RATES

Year	Net Operating Income	Derived Capitalization Rate
Forecast 2018/19	$2,332,000	6.5 %
Deflated Stabilized (2018/19) Dollars	2,798,000	7.8

The derived capitalization rates are considered appropriate for a proposed lodging facility such as the Proposed Holiday Inn Express & Suites Woodside. The derived capitalization rates that are based on the forecasted net operating income fall in line with acceptable returns for a hotel of this caliber. We note that these capitalization rates reflect the expectation of continued improvement in profitability over the initial years of the forecast. Investors are acquiring assets at "going-in" capitalization rates that reflect the anticipation of a future upside as the economy continues to grow.

Given the proposed subject property's location in Queens, NY with easy access to Manhattan, the subject property's capitalization rates are further supported by historical sales in the Manhattan market. For referential purposes, the following provides capitalization rates derived from hotel sales within the Manhattan market, over the past several years. As illustrated, hotel sales in Manhattan have been historically marked with relatively low capitalization rates.

Note that although other sales have occurred in Manhattan, we have only provided sales in the following for which we were able to derive the capitalization rate.

FIGURE 11-25 MANHATTAN HOTEL SALES – DERIVED CAPITALIZATION RATES

Property	Date of Sale	No. of Rooms	Price	Price per Room	Indicated Cap. Rate
Mondrian Soho	Apr-15	270	$205,000,000	$759,000	5.9%

Discounted Cash Flow Analysis – "When Complete"

The process of converting the projected income stream into an estimate of value via the discounted-cash-flow method is described as follows.

1. An appropriate discount rate is selected to apply to the projected net income before debt service. This rate reflects the "free and clear" internal rate of return to an all-cash purchaser or a blended rate of debt and equity return requirements. The discount rate takes into consideration the degree of perceived risk, anticipated inflation, market attitudes, and rates of return on other investment alternatives, as well as the availability and cost of financing. The discount rate is chosen by reviewing sales transactions and investor surveys and interviewing market participants.
2. A reversionary value reflecting the sales price of the property at the end of the ten-year holding period is calculated by capitalizing the eleventh-year net income by the terminal capitalization rate and deducting typical brokerage and legal fees.
3. Each year's forecasted net income before debt service and depreciation and the reversionary sales proceeds at the end of the ten-year holding period are converted to a present value by multiplying the cash flow by the chosen discount rate for that year in the forecast. The sum of the discounted cash flows equates to the value of the subject property.

The following chart summarizes the averages presented for discount rates in various investor surveys during the past decade.

Second Tier Hotels	7.4% - 13.0%	10.4%
Third Tier Hotels	9.0% - 14.0%	11.3%

We note that the averages illustrated in the previous table are derived from wide arrays of data points, and a range of reasonableness extends both lower and higher than the indicated data points. Based on our review of these surveys, sales transactions (see total property yields shown in the table titled *Sample of Hotels Sold*), and interviewing market participants, we have selected a discount rate of 9.25% for our analysis, reflective of the subject property's location in New York City. Similar to the developed total property yield, our selected discount rate considers the current market for hotel investments, as well as the characteristics of the property and market.

Utilizing the discount rate set forth, the discounted-cash-flow procedure is summarized as follows.

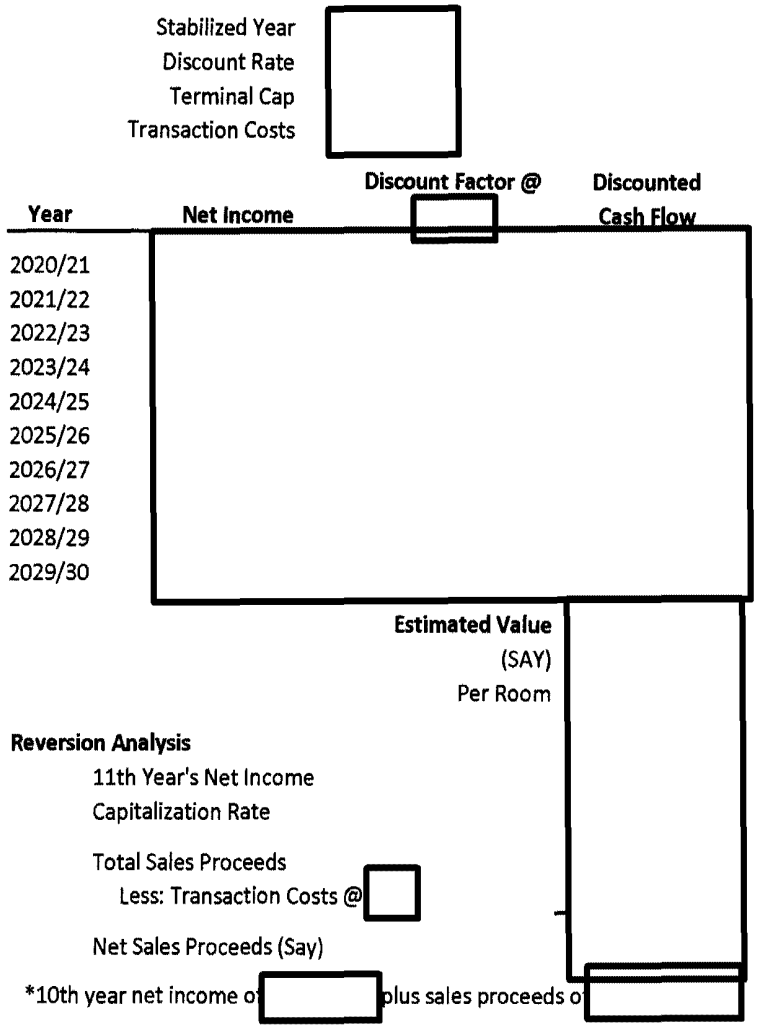
Discounted Cash Flow Analysis – "When Stabilized"

The preceding valuation process was repeated using the projected cash flows beginning as of the stabilized year. The discounted-cash-flow procedure is summarized as follows.

(b)(4)

(b)(4)

FIGURE 11-29 DISCOUNTED CASH FLOW ANALYSIS—STABILIZED VALUE



Based on this procedure, it is our opinion that the prospective market value, as of March 1, 2020, is this equates to per room.

Conclusion

Using the income capitalization approach, the subject property was valued by a mortgage-equity analysis, a straightforward discounted-cash-flow analysis, and a direct capitalization technique. Based on our review of each method and their inherent strengths and weaknesses, as well as investor attitudes and methodologies, we have reconciled the "when complete" value indication via the income capitalization approach to Furthermore, it is our opinion that the "when stabilized" value is

(b)(4)

12. Sales Comparison Approach

The sales comparison approach is based on the principle of substitution, which defines a property's value as the cost of acquiring an equally desirable substitute (assuming that no costly delay is incurred in making the substitution). Thus, the sales comparison approach can be used to form an opinion of a property's market value from the price at which equally desirable properties have sold, or for which they can be purchased, on the open market.

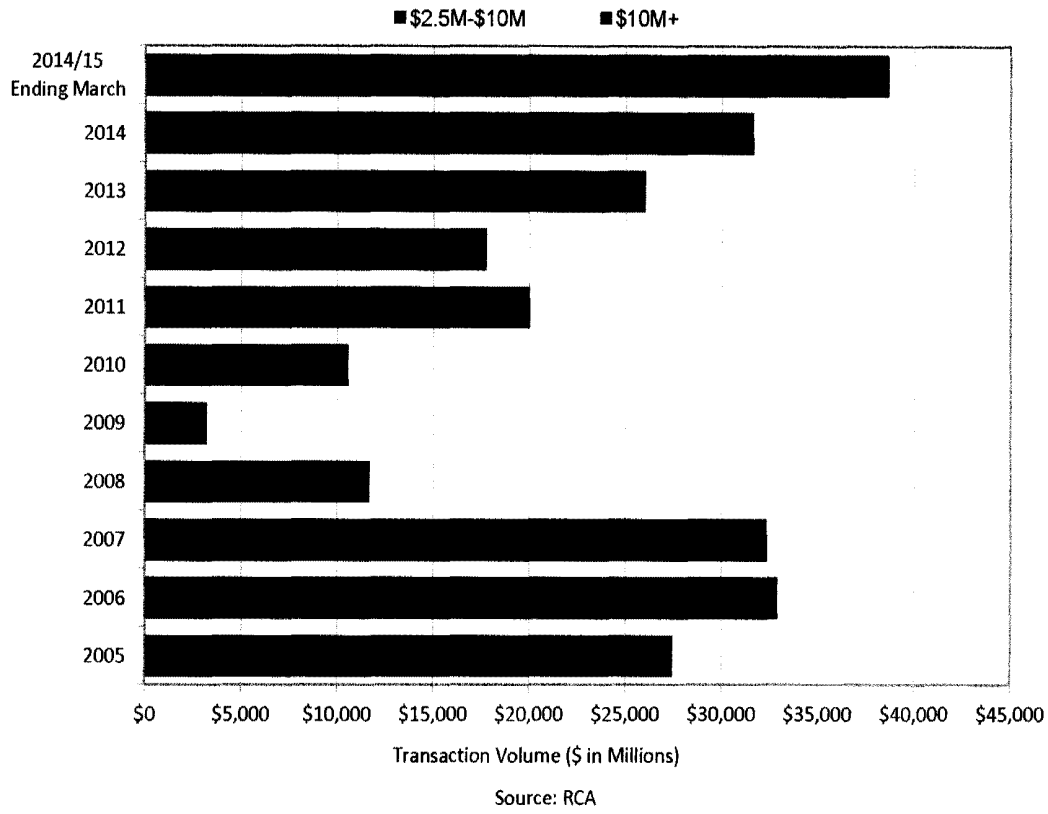
Hotel Investment Market Overview

The following overview of the hotel investment market during recent industry investment cycles provides a context for the sales comparison approach.

The volume of hotel transactions and the price paid for individual assets are influenced by two principal factors: the availability of capital and the performance of the lodging sector as a whole. When high levels of leverage are available on favorable terms and the industry is performing well, investors are attracted to the market, and both prices and the number of transactions increase. These market conditions often induce sellers to put their properties on the market, further fueling the pace of transaction activity. Conversely, when the availability of capital declines and when interest rates increase, both the pace of activity and pricing levels decrease. When these capital conditions coincide with a downturn in industry performance, the transaction market drops off significantly. In this environment, sellers are typically unwilling to put their properties on the market, electing to wait until market conditions improve. The impact of these influences results in a cyclical investment market, recording peaks and valleys in response to changes in the capital markets and the economy.

The following chart sets forth the dollar volume of U.S. hotel transactions over the past ten years through the trailing-twelve-month (TTM) period ending June 2015, as reported by Real Capital Analytics. The blue portion of the bar chart represents the volume of transactions with a price in excess of $10 million, identified as Major Sales Transactions, while the red portion of the bar represents the volume of transactions with a price of $2.5 million to $10 million.

FIGURE 12-1 U.S. HOTEL TRANSACTION VOLUME BY YEAR (SALES ABOVE $2.5M)

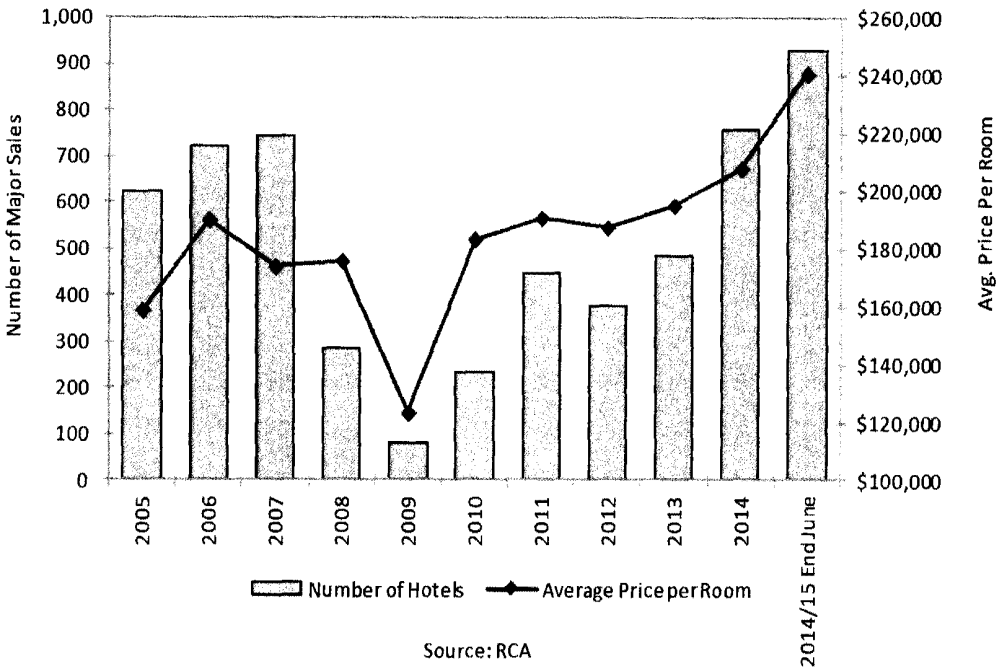


Source: RCA

The cyclical nature of the hospitality investment market is evident in the sales data. Following peak levels of activity in 2006 and 2007, hotel transaction activity slowed dramatically in 2008 because of the weakening economy and reduction in CMBS lending. The market came to a virtual standstill in 2009 due to the financial crisis, which negatively affected the hotel and real estate industries. With a recovery in fundamentals underway, transaction activity began to recover in 2010. Sales activity has continued to increase since that time, driven by strong industry fundamentals and favorable investment market conditions. Total sales volume (for transactions of over $2.5 million in value) increased by roughly 22% from 2013 to 2014, reaching just over $31 billion, still about $1 billion shy of the peak levels recorded in 2006 and 2007. Given the very strong outlook for hotel performance and the continuing availability of low cost capital, sales volume in the TTM period ending June 2015 exceeded prior peak levels.

The following graph sets forth the number of major hotel transactions (defined as those with a purchase price in excess of $10 million) and the average price per room since 2005.[15]

FIGURE 12-2 U.S. HOTEL TRANSACTIONS BY YEAR (SALES ABOVE $10M)



The average price per room for hotels selling at a price of $10 million and over reached roughly $208,000 in 2014, a 7% increase over the prior year. For the TTM period ending June 2015, the average price per room for this price category surpassed $240,000. It should be noted that the average price per room is greatly influenced by the types of hotels being sold. In 2014, the transaction market was dominated by the sale of limited- and select-service hotels, with relatively fewer large, full-service and luxury assets transacting, which served to moderate the value-per-room gain. The number of hotels that sold in 2014 at a price of $10 million and over increased by 57%, reflecting the greater number of smaller, lower-priced hotel transactions over 2013.

[15] Real Capital Analytics' individual and portfolio hotel transactions data

Major sales transaction activity, defined as hotels that sell in excess of $10 million, mirrors the total sales trend. Since its nadir in 2009, the market recovered to 761 major sales transactions in 2014 (933 on a TTM basis, ending June 2015), reflecting a major gain over the 484 major sales total in 2013. As of mid-year 2015, the market is in a healthy state of equilibrium; equity interest in the sector remains strong, and debt is widely available at favorable interest rates. These factors, combined with continued strong industry fundamentals, are attracting more investors and sellers to the market. International investors looking for a safe haven for their capital and REITs, which performed very well in 2014, are expected to remain the most active buyers in 2015/16. Limited- and select-service hotels, many of which sold in portfolios that represented 30% of all major transaction activity in 2014, are anticipated to remain the most active product type. Competition for high-quality assets in gateway cities remains strong, driving many buyers to pursue assets in secondary markets. As the cycle evolves, investor interest is broadening outside the premier sectors and markets. While some aging assets and/or those in need of unfunded capital improvements may continue to be challenged, capital is increasingly available for asset turnarounds, which is also beginning to boost activity in this segment of the market.

The improvements in market conditions since 2012 have resulted in increased sales transaction activity reflective of investor expectations in a normalized market. Thus, we have tried to focus on sales transactions from 2012 to the present, if adequate comparable data are available. Sales from prior years may be pertinent if there has been sparse activity in the subject property's product type since the 2008/09 economic downturn. Capitalization rates derived from the historical income of the sales vary widely, depending upon when the sale occurred and how a hotel was performing at the time of sale. Given these factors, we have researched and relied upon the most relevant comparable sales data in our appraisal of the subject property, although adjustments for changes in capital market conditions may be warranted, depending on the date and particular attributes of the transaction.

Sales History of Subject

The developer of the proposed subject hotel is Queens Blvd Ventures, LLC, a subsidiary of Century Development Group. The ownership group entered into an agreement to purchase the subject site on March 4, 2014 for a reported sum of $6,000,000. According to public records, the sale was closed in February of 2015. No other transfers of the property have reportedly occurred in the past three years. The site is neither listed nor under contract for sale; furthermore, we have no knowledge of any recent listings.

Comparable Sales

To present our selection of comparable sales, we conducted a comprehensive search for transactions of hotels that bear comparison to the subject property in one or more key areas. When possible, we gave priority to transactions occurring in the same state or region as the subject property. We also considered factors such as operational and physical similarities to the subject property, including brand affiliation and revenue-generating aspects. We have primarily focused on transactions that occurred within the last three years because of changes in market conditions since that time.

As illustrated by the preceding, a number of properties have transacted over the recent past in New York City. Of the preceding, three sales are considered the most comparable. The following detail the adjustments made to such sales and the resulting sales comparison approach value range that is developed.

(b)(4)

** Includes $21 million planned renovations*

(b)(4)

Please note that the ***LaGuardia Airport Hotel*** was partially closed at the time of transaction. The hotel required significant renovations, and the buyer intended to invest an additional [redacted] to redevelop the property and convert it into two separate hotels - an aloft and an ibis Style. For the purpose of this analysis, we have added the planned capital expenditures to the sale price.

Market Conditions

The lack of financing and more stringent underwriting terms, combined with limited investor interest, resulted in poor investment market conditions from the third quarter of 2008 into 2010. Beginning mid-year 2010, investor interest and the large volume of equity capital seeking quality hotel investments resulted in improved market conditions. In the latter half of 2011, market conditions regressed somewhat as investors and lenders became more cautious and capital was less available. This caution eased in early 2012, and market conditions returned to those that prevailed in late 2010 and early 2011. Beginning mid-year 2012, the cost and availability of mortgage capital improved significantly, with interest rates falling below the levels experienced at the peak of the market in 2006 and 2007. This trend continued through 2013 and 2014, with interest rates remaining low and loan-to-value ratios rising in response to increased lender interest in the hospitality sector. In recognition of the changing market conditions, upward adjustments were applied to all transactions, which occurred in 2014 or earlier.

Location/Market

The adjustment for differences in location or market is intended to consider any specific locational attributes that would influence the value of the hotel over and above the influence reflected in the revenue levels achieved by the property. Typically, these influences are tied to the characteristics of the site and are most common when an asset is in a location or market that has high barriers to entry. Downward adjustments were applied to Sales #1 and #2 given the assets' location in downtown Flushing and the immediate airport area, respectively.

Physical Condition/ Facilities

Adjustments for physical condition or facilities address differences in the condition of the property at the time of sale, the age of the property as of the date of sale, and/or the array of facilities available. Upward adjustments for physical condition were applied to all transactions given the assets' earlier dates of construction, and aging physical products considered inferior to that of the subject property upon opening.

Other Revenue Sources

Adjustments for other revenue sources and additional facilities are necessary to account for significant differences in revenue sources, such as food and beverage outlets, meeting space, or other operating departments, aside from rooms. A downward adjustment for other revenue sources was applied to the transaction noted as Sale #2 given the asset's superior select-service product type upon completion and its revenue-generating restaurant/bar.

(b)(4)

Conclusion

Prior to adjustments, the comparable sales transacted for amounts ranging from [redacted] per room. Following all adjustments, we have positioned an appropriate value at [redacted] per room, or [redacted] to [redacted] for the 135-room subject property upon completion.

FIGURE 12-5 SALES COMPARISON APPROACH – RANGE OF VALUES

Property	Location	Sale Date	Price	Rooms	Price/Rm

(b)(4)

13. Cost Approach

The cost approach reflects a set of procedures through which a value indication is derived for the fee simple interest in a property by estimating the current cost to construct a reproduction of, or replacement for, the existing structure; deducting accrued depreciation from the reproduction or replacement cost; and adding the estimated land value plus an entrepreneurial profit. Adjustments may then be made to the indicated fee simple value of the subject property to reflect the value of the property interest being appraised.

Because the subject property is proposed, the cost approach has some applicability. In this report section, we will estimate the replacement cost as new of the improvements, review the hotel's construction budget, estimate the market value of the site, and add an entrepreneurial profit incentive to arrive at the total cost new to develop the subject property. The total cost new to build the facility is often used by hotel buyers as a benchmark against the income and sales indications - particularly for new hotels.

Development Cost Summary

The following table presents the development budget (excluding site cost) based on the information provided by ownership representatives.

(b)(4)

Land Valuation

Land value may be estimated in a variety of ways including the sales comparison approach and the allocation, extraction, or ground rent capitalization methods. For the majority of hostelry properties, the two primary methods used are the sales comparison approach and the ground lease capitalization approach.

Ground Lease Approach to Land Value

Land value may be estimated in a variety of ways including the sales comparison approach and the allocation, extraction, or ground rent capitalization methods. For the majority of hostelry properties, the two primary methods used are the sales comparison approach and the ground lease capitalization approach.

Over the past several years, hotels and resorts have routinely been constructed on leased land. While the lease terms differ somewhat from property to property, the basis for the rental calculation is often tied to a percentage of revenue formula. Using the forecasted revenues for the subject property and applying a typical hotel ground lease rental formula, the appraiser can determine the hotel's economic rental, or what can be termed the income attributed to the land. The land value can then be estimated by capitalizing the hypothetical ground rent. The self-adjusting aspect of this approach is a key element to its reliability.

We have researched actual long-term ground leases encumbering hotels in New York City. Based on our experience, ground rental percentages may range between 6.0% and 10.0% because of the scarcity of prime sites. In light of this factor, we

believe that an economic ground rent percentage of 8.0% of deflated stabilized rooms revenue is appropriate in the case of the subject property, due to its location. Based on the revenue projections set forth for the subject property as part of this appraisal, the following table shows how the economic ground rent has been calculated. Note that the stabilized revenue level has been deflated back to first projection year dollars.

Deflated Stabilized Rooms Revenue	[redacted]	(b)(4)
Rental Percentage		
Economic Ground Rent		

Rent generated from an unsubordinated ground lease represents a low-risk flow of income. Because the tenant improvements typically amount to more than five times the value of the land, the risk of default is almost nonexistent. For hotel ground leases where rent is tied to revenue, the property owner is also protected from the adverse effects of inflation. Based on these minimal risk factors and the current cost of long-term capital, it is our opinion that the appropriate ground rent overall capitalization rate would be as indicated in the following table because of the aforementioned low level of risk.

Applying the indicated capitalization rate to the proposed subject hotel's economic ground rent results in the following estimate of land value.

Economic Ground Rent / Capitalization Rate	=	[redacted]	(b)(4)

This conclusion has been rounded to $10,400,000 in the remainder of our analysis.

Entrepreneurial Incentive

Entrepreneurial incentive represents the anticipated monetary benefit for hotel developers to induce the construction of a new hotel project. As a result of economic conditions in the hotel industry, developer's profit has not always been in evidence. If the economic value of a new hotel does not exceed development cost, indicating that developers will not earn any profit from their effort, the project most likely would not go forward because the financial incentive is not present. We note that our estimate of entrepreneurial incentive is calculated as 25.0% of the development cost. The following illustrates our calculation.

FIGURE 13-2 ENTREPRENEURIAL INCENTIVE ESTIMATE

(b)(4)

Total Development Cost

In the estimation of value according to the cost approach, the values of several components of the total property were quantified. Land value was based on the ground lease approach. The development cost of the building improvements and personal property was estimated based on the actual development budget or cost as previously presented. The following table summarizes our estimate of the total cost new to build the subject property.

FIGURE 13-3 RECAP OF TOTAL DEVELOPMENT COST

Item	Amount
Construction	
Furniture, Fixtures & Equipment	
Soft Costs	
Land Value	
Entrepreneurial Incentive	
Total Replacement Cost	
Rounded to	

(b)(4)

We have estimated the total development cost at roundly $35,500,000. Due to the hotel's proposed status, this value estimate is considered somewhat applicable to our appraisal analysis.

Insurable Value

We have estimated the insurable value of the proposed subject hotel. The starting point for the estimation of value for insurance purposes is the replacement cost of the building and site improvements.

For the purpose of estimating insurable value, only hard or direct construction costs should be reflected; therefore, certain exclusions need to be taken into consideration. Exclusions typically constitute 5.0% to 10.0% of the replacement cost and include items such as landscaping, parking, other yard improvements, and the foundation or sub-structure. In this analysis, a 5.0% adjustment was made to the replacement cost of the hotel to account for these exclusions. The estimated

(b)(4)

replacement cost of the personal property is added to the adjusted replacement cost of the building. Based on the developer's construction budget, the replacement cost of personal property is estimated to be approximately [redacted] per room, or [redacted] in total.

Our estimate of insurable value is presented in the following table.

FIGURE 13-4 ESTIMATE OF INSURABLE VALUE

Building Replacement Cost	
Less Exclusions (5%)	
Insurable Value of Structures	
Plus Furniture, Fixtures, & Equipment	
Total Insurable Value	
Rounded to:	

(b)(4)

It should be noted that the exclusions that are subtracted to calculate insurable value are a matter of underwriting policy rather than valuation methodology. Different insurance policies may exclude all or only some of the items outlined herein. We have deducted all the exclusions that are typical in determining insurable value; however, the reader is advised to examine each applicable insurance policy (including riders and endorsements) to determine the exclusions that should be considered when determining insurable value.

Although excavations and foundations are typically excluded from replacement cost in determining insurable value, re-use of these areas of the structure may not be permissible or maximally productive as a result of changes in the neighborhood's character, surrounding land uses, building styles, building codes, and the necessity of repair and modification. Architect's fees are also typically deducted from replacement cost in determining insurable value, but this provision assumes both that the building would be reconstructed in the same design, and that the original plans would be available. We have estimated insurable value in a manner typically accepted by investors, but it is important to note the factors cited above when examining the estimate of insurable value.

This analysis should not be relied upon to determine actual insurance coverage, which can be properly estimated only by consultants considered experts in cost estimation and insurance underwriting. It is provided to aid in the overall decision-making process of the client/reader/user, and no representations or warranties are made by HVS regarding the accuracy of this estimate. We strongly

recommend that other sources be utilized to develop any estimate of insurable value.

Value of the Personal Property

Personal property is an integral part of a transient lodging facility. Without furniture, fixtures, and equipment, a hotel could not operate its facilities and rent its guestrooms, and thus would not be able to generate any income attributable to the real property. Personal property and real property are uniquely combined in a hotel; unlike an office or other commercial building, a hotel would have to close its doors without furniture, fixtures, and equipment.

The physical separation of personal property from real property in a hotel is a theoretical issue rather than a practical matter. Lodging facilities are generally sold with their furniture, fixtures, and equipment in place. While a lender may be restricted from financing the purchase of personal property, a hotel's real property would have little value without personal property.

The removal of personal property from a hotel for sale would result in a minimal sales price for the personal property. Furniture, fixtures, and equipment, once installed, depreciate very rapidly. Most furnishings in a hotel can command little more than a salvage value substantially lower than the original cost when sold separately from the improvements. Given the proposed nature of the subject property, the value of the personal property is reflected by the furniture, fixtures, and equipment estimate presented previously, rounded to [redacted] (b)(4)

The following table sets forth a depreciation schedule developed by HVS for determining the market value, or "value in exchange," of a hotel's FF&E. The depreciation estimates represent the average depreciation applicable to the entirety of a hotel's personal property; these have been applied to the original cost of the FF&E.

FIGURE 13-5 FURNITURE, FIXTURES, AND EQUIPMENT DEPRECIATION SCHEDULE

10	98

Source: HVS

At stabilization, the effective age, considering any replacements that are expected to occur prior to the stabilized year, is estimated to be three years. Using an adjusted replacement cost per room of and a depreciation factor of 70.0%, the estimated value of the personal property when stabilized will be [redacted]

(b)(4)

14. Reconciliation of Value Indications

The reconciliation, which is the last step in the appraisal process, involves summarizing and correlating the data and procedures employed throughout the analysis. The final value conclusion is arrived at after reviewing the estimates indicated by the income capitalization, sales comparison, and cost approaches. The relative significance, applicability, and defensibility of each indicated value are considered, and the greatest weight is given to that approach deemed most appropriate for the property being appraised.

The purpose of this report is to estimate the market value of the fee simple interest in the subject property; our appraisal involves a careful analysis of the property itself and the economic, demographic, political, physical, and environmental factors that influence real estate values.

Income Capitalization Approach

To estimate the subject property's value via the income capitalization approach, we have analyzed the local market for transient accommodations, examined the competitive environment, projected occupancy and average rate levels, and developed a forecast of income and expense that reflects anticipated income trends and cost components through a stabilized year of operation. The subject property's projected net income before debt service was allocated to the mortgage and equity components based on market rates of return and loan-to-value ratios. Through a discounted cash flow and income capitalization procedure, the value of each component was calculated; the total of the mortgage and equity components equates to the value of the property.

Our nationwide experience indicates that the procedures used in estimating market value by the income capitalization approach are comparable to those employed by the hotel investors who constitute the marketplace. For this reason, we believe that the income capitalization approach produces the most supportable value estimate, and it is given the greatest weight in our final estimate of the subject property's market value.

Sales Comparison Approach

The sales comparison approach uses actual sales of similar properties to provide an indication of the subject property's value. Although we have investigated a number of sales in an attempt to develop a range of value indications, several adjustments are necessary to render these sales prices applicable to the subject property. The adjustments, which tend to be subjective, diminish the reliability of the sales comparison approach; furthermore, typical hotel investors employ a sales comparison procedure only to establish broad value parameters.

(b)(4)

The hotel sales outlined earlier in this report indicate an adjusted value range of [redacted] per available room. The income capitalization approach indicates a per room value of [redacted] This information supports the value indicated by the income capitalization approach.

Cost Approach

As discussed in the Cost Approach chapter, this methodology is applicable for this property, as it is proposed, and has been heavily considered in our reconciliation process.

Value Conclusion

Careful consideration has been given to the strengths and weaknesses of the three approaches to value discussed above. In recognition of the purpose of this appraisal, we have given primary weight to the value indicated by the income capitalization approach.

The "as is" market value of the property is calculated by adding the hard and soft costs spent-to-date to the estimated land value. Based on information provided by ownership representatives, approximately [redacted] has been spent on items such as architect retainer fee, structure engineer retainer fee, real estate taxes, permitting, franchise application, and other professional and financing expenses. Our calculation is illustrated in the following table.

FIGURE 14-1 "AS IS" VALUE CALCULATION

"As Is" Value Calculation	Amount
Land Value Opinion	[redacted]
Plus	
Amount Spent-to-Date	
"As-Is" Market Value	
Rounded to:	

Based on our analysis, it is our opinion that the "as is" market value of the fee simple interest in the Proposed Holiday Inn Express & Suites Woodside, as of August 3, 2015, is [redacted]

Based on our analysis, it is our opinion that the "when complete" market value of the fee simple interest in the real and personal property of the Proposed Holiday Inn Express & Suites Woodside, as of March 1, 2018, will be:

[redacted]

(b)(4)

(b)(4)

This value estimate equates to [redacted] per room. We have also estimated the prospective market value of the subject property as of its projected date of stabilization. Based on our analysis, it is our opinion that the "when stabilized" prospective market value of the fee simple interest in the real and personal property of the Proposed Holiday Inn Express & Suites Woodside, as of March 1, 2020, will be:

[redacted]

This value opinion equates to [redacted] per room. The estimates of market value include the land, the improvements, and the furniture, fixtures, and equipment. The appraisal assumes that the hotel is open and operational.

(b)(4)

We have made no assumptions of hypothetical conditions in our report. The analysis is based on the extraordinary assumption that the described improvements have been completed as of the prospective "when complete" date of value. The reader should understand that the completed subject property does not yet exist as of the date of appraisal. Our appraisal does not address unforeseeable events that could alter the proposed project and/or the market conditions reflected in the analyses; we assume that no significant changes, other than those anticipated and explained in this report, shall take place between the date of inspection and date of prospective value. Furthermore, the subject property is located in a designated "Special Area" for tax purpose; our projection is predicated upon the extraordinary assumption that the subject hotel will receive the ICAP tax abatement for a 25-year period. The use of these extraordinary assumptions may have affected the assignment results. We have made no other extraordinary assumptions specific to this appraisal. However, several important general assumptions have been made that apply to this appraisal and our valuations of proposed hotels in general. These aspects are set forth in the Assumptions and Limiting Conditions chapter of this report.

Allocation of Value

USPAP requires the appraiser to "identify any personal property, trade fixtures, or intangible items that are not real property but are included in the appraisal" and "to analyze the effect on value of such non-real property items."[16] The estimates of prospective market value include the land, improvements, and personal property. The appraisal assumes that the hotel is open and operational at this time.

[16] The Appraisal Foundation, Uniform Standards of Professional Appraisal Practice, 2012-2013 Ed. (Washington: The Appraisal Foundation, 2012).

Hotels comprise three primary components: the real property (land and improvements), personal property, and intangible property. Real property is "the interests, benefits, and rights inherent in the ownership of real estate (land and improvements."[17] Personal property is defined as "identifiable tangible objects that are considered by the general public as being 'personal' - for example, furnishings, artwork, antiques, gems and jewelry, collectibles, machinery and equipment; all tangible property that is not classified as real estate."[18]

The personal property consists of the furniture, fixtures, and equipment (FF&E) and the inventories in place at the subject property as of the date of value. Personal property is an integral part of a transient lodging facility. The allocation of a portion of the overall hotel's value to the personal property is not explicitly considered by hotel investors in making their pricing decisions. Lodging facilities are usually sold with their personal property in place. In accordance with the Uniform Standards of Professional Appraisal Practice (USPAP), the appraisers have delineated the market value of the subject hotel's personal property.

USPAP defines intangible property as "nonphysical assets, including but not limited to franchises, trademarks, patents, copyrights, goodwill, equities, securities, and contracts as distinguished from physical assets such as facilities and equipment."[19] All value attributable to the intangible property has been removed with the assumed expense of a management fee and a franchise fee (if applicable) in the valuation process.

Our concluded opinions of the subject hotel's market value include the value of the real property (land and improvements) and the value of the personal property only.

16. Certification

The undersigned hereby certify that, to the best of our knowledge and belief:

1. the statements of fact presented in this report are true and correct;
2. the reported analyses, opinions, and conclusions are limited only by the reported assumptions and limiting conditions, and are our personal, impartial, and unbiased professional analyses, opinions, and conclusions;
3. we have no (or the specified) present or prospective interest in the property that is the subject of this report and no (or the specified) personal interest with respect to the parties involved;
4. we have no bias with respect to the property that is the subject of this report or to the parties involved with this assignment;
5. our engagement in this assignment was not contingent upon developing or reporting predetermined results;
6. our compensation for completing this assignment is not contingent upon the development or reporting of a predetermined value or direction in value that favors the cause of the client, the amount of the value opinion, the attainment of a stipulated result, or the occurrence of a subsequent event directly related to the intended use of this appraisal;
7. our analyses, opinions, and conclusions were developed, and this report has been prepared, in conformity with the Uniform Standards of Professional Appraisal Practice;
8. Chu Y. Xu and Roland deMilleret, MAI personally inspected the property described in this report;
9. Chu Y. Xu provided significant real property appraisal assistance to Roland deMilleret, MAI, and that no one other than those listed above and the undersigned prepared the analyses, conclusions, and opinions concerning the real estate that are set forth in this appraisal report; Roland deMilleret, MAI has performed one appraisal on the property that is the subject of this report within the three-year period immediately preceding acceptance of this assignment;
10. the reported analyses, opinions, and conclusions were developed, and this report has been prepared, in conformity with the requirements of the Code of Professional Ethics and the Standards of Professional Appraisal Practice of the Appraisal Institute;

11. the use of this report is subject to the requirements of the Appraisal Institute relating to review by its duly authorized representatives; and

12. as of the date of this report, Roland deMilleret, MAI has completed the continuing education program for Designated Members of the Appraisal Institute.

Penetration Explanation

Let us illustrate the penetration adjustment with an example.

A market has three existing hotels with the following operating statistics:

BASE-YEAR OCCUPANCY AND PENETRATION LEVELS (b)(4)

Property	Number of Rooms	Fair Share	Commercial	Meeting and Group	Leisure	Occupancy	Penetration
Hotel A							
Hotel B							
Hotel C							
Totals/Average							

Based upon each hotel's room count, market segmentation, and annual occupancy, the annual number of room nights accommodated in the market from each market segment can be quantified, as set forth below.

MARKET-WIDE ROOM NIGHT DEMAND

Market Segment	Annual Room Night Demand	Percentage of Total
Commercial		
Meeting and Group		
Leisure		
Total		

(b)(4)

HVS

The following discussion will be based upon an analysis of the commercial market segment. The same methodology is applied for each market segment to derive an estimate of a hotel's overall occupancy. The table below sets forth the commercial demand accommodated by each hotel. Each hotel's commercial penetration factor is computed by:

1) calculating the hotel's market share % of commercial demand (commercial room nights accommodated by subject hotel divided by total commercial room nights accommodated by all hotels) and

2) dividing the hotel's commercial market share % by the hotel's fair share %.

The following table sets forth each hotel's fair share, commercial market share, and commercial penetration factor.

COMMERCIAL SEGMENT PENETRATION FACTORS (b)(4)

Property	Number of Rooms	Fair Share	Commercial Capture	Commercial Market Share	Commercial Penetration
Hotel A					
Hotel B					
Hotel C					
Totals/Average					

If a new 100-room hotel enters the market, the fair share of each hotel changes because of the new denominator, which has increased by the 100 rooms that have been added to the market.

COMMERCIAL SEGMENT FAIR SHARE

Property	Number of Rooms	Fair Share
Hotel A		
Hotel B		
Hotel C		
New Hotel		
Total		

(b)(4)

The new hotel's penetration factor is projected for its first year of operation. It is estimated that the hotel will capture (penetrate) only 85% of its fair share as it establishes itself in the market. The new hotel's market share and room night capture can be calculated based upon the hotel's estimated penetration factor. When the market share of the existing hotels and that of the new hotel are added up, they no longer equal 100% because of the new hotel's entry into the market. The market share of each hotel must be adjusted to reflect the change in the denominator that comprises the sum of each hotel's market share.

This adjustment can be mathematically calculated by dividing each hotel's market share percentages by the new denominator of 97.1%. The resulting calculations reflect each hotel's new adjusted market share. The sum of the adjusted market shares equals 100%, indicating that the adjustment has been successfully completed. Once the market shares have been calculated, the penetration factors can be recalculated (adjusted market share divided by fair share) to derive the adjusted penetration factors based upon the new hotel's entry into the market. Note that each existing hotel's penetration factor actually increases because the new hotel is capturing (penetrating) less than its fair share of demand.

COMMERCIAL SEGMENT PROJECTIONS (YEAR 1)

Property	Number of Rooms	Fair Share	Hist./Proj. Penetration Factor	Hist./Proj. Market Share	Adjusted Market Share	Adjusted Penetration Factor	Projected Capture
Hotel A							
Hotel B							
Hotel C							
New Hotel							
Totals/Average							

(b)(4)

In its second year of operation, the new hotel is projected to penetrate above its fair share of demand. A penetration rate of 130% has been chosen, as the new hotel is expected to perform at a level commensurate with Hotel A and Hotel B in this market segment. The same calculations are performed to adjust market share and penetration factors. Note that now the penetration factors of the existing hotels decline below their original penetration rates because of the new hotel's above-market penetration. Also, note that after the market share adjustment, the new hotel retains a penetration rate commensurate with Hotel A and Hotel B, though the penetration rates of all three hotels have declined by approximately nine percentage points because of the reapportionment of demand.

Once the market shares of each hotel have been adjusted to reflect the entry of the new hotel into the market, the commercial room nights captured by each hotel may be projected by multiplying the hotel's market share percentage by the total commercial room-night demand. This calculation is shown below.

COMMERCIAL SEGMENT PROJECTIONS (YEAR 2)

Property	Number of Rooms	Fair Share	Hist./Proj. Penetration Factor	Hist./Proj. Market Share	Adjusted Market Share	Adjusted Penetration Factor	Projected Capture
Hotel A							
Hotel B							
Hotel C							
New Hotel							
Totals/Average							

(b)(4)

Explanation of the Simultaneous Valuation Formula

The algebraic equation known as the simultaneous valuation formula, which solves for the total property value using a ten-year mortgage and equity technique, was developed by Suzanne R. Mellen, CRE, MAI, FRICS, ISHC, Senior Managing Director of the San Francisco office of HVS. A complete discussion of the technique is presented in her article entitled "Simultaneous Valuation: A New Technique."[20]

The process of solving for the value of the mortgage and equity components begins by deducting the annual debt service from the projected income before debt service, leaving the net income to equity for each year. The net income as of the eleventh year is capitalized into a reversionary value using the terminal capitalization rate. The equity residual, which is the total reversionary value less the mortgage balance at that point in time and less any brokerage and legal costs associated with the sale, is discounted to the date of value at the equity yield rate. The net income to equity for each projection year is also discounted back to the date of value. The sum of these discounted values equals the value of the equity component. Because the equity component comprises a specific percentage of the total value, the value of the mortgage and the total property can be computed easily. This process can be expressed in two algebraic equations that set forth the mathematical relationships between the known and unknown variables using the following symbols.

[20] Suzanne R. Mellen, "Simultaneous Valuation: A New Technique," *Appraisal Journal*, April 1983.

NI	=	Net income available for debt service
V	=	Value
M	=	Loan-to-value ratio
f	=	Annual debt service constant
n	=	Number of years in the projection period
d_e	=	Annual cash available to equity
d_r	=	Residual equity value
b	=	Brokerage and legal cost percentage
P	=	Fraction of the loan paid off during the projection period
f_p	=	Annual constant required to amortize the entire loan during the projection period
R_r	=	Overall terminal capitalization rate that is applied to net income to calculate the total property reversion (sales price at the end of the projection period)
$1/S^n$	=	Present worth of $1 factor (discount factor) at the equity yield rate

Using these symbols, the following formulas can be used to express some of the components of this mortgage and equity valuation process.

Debt Service – A property's debt service is calculated by first determining the mortgage amount that equals the total value (V) multiplied by the loan-to-value ratio (M). Debt service is derived by multiplying the mortgage amount by the annual debt service constant (f). The following formula represents debt service.

$$f \times M \times V = \text{Debt Service}$$

Net Income to Equity (Equity Dividend) – The net income to equity (d_e) is the property's net income before debt service (NI) less debt service. The following formula represents the net income to equity.

$$NI - (f \times M \times V) = d_e$$

Reversionary Value – The value of the hotel at the end of the tenth year is calculated by dividing the eleventh-year net income before debt service (NI^{11}) by the terminal capitalization rate (R_r). The following formula represents the property's tenth-year reversionary value.

$$(NI^{11}/R_r) = \text{Reversionary Value}$$

Brokerage and Legal Costs - When a hotel is sold, certain costs are associated with the transaction. Normally, the broker is paid a commission and the attorney collects legal fees. In the case of hotel transactions, brokerage and legal costs typically range from 1% to 4% of the sales price. Because these expenses reduce the proceeds to the seller, they are usually deducted from the reversionary value in the mortgage and equity valuation process. Brokerage and legal costs (b), expressed as a percentage of reversionary value (NI^{11}/R_r), are calculated by application of the following formula.

$$b\ (NI^{11}/R_r) = \text{Brokerage and Legal Costs}$$

Ending Mortgage Balance - The mortgage balance at the end of the tenth year must be deducted from the total reversionary value (debt and equity) in order to determine the equity residual. The formula used to determine the fraction of the loan remaining (expressed as a percentage of the original loan balance) at any point in time (P) takes the annual debt service constant of the loan over the entire amortization period (f) less the mortgage interest rate (i), and divides it by the annual constant required to amortize the entire loan during the ten-year projection period (f_p) less the mortgage interest rate. The following formula represents the fraction of the loan paid off (P).

$$(f - i)/(f_p - i) = P$$

If the fraction of the loan paid off (expressed as a percentage of the initial loan balance) is P, then the remaining loan percentage is expressed as 1 - P. The ending mortgage balance is the fraction of the remaining loan (1 - P) multiplied by the initial loan amount (M x V). The following formula represents the ending mortgage balance.

$$(1 - P) \times M \times V$$

Equity Residual Value - The value of the equity upon the sale at the end of the projection period (d_r) is the reversionary value less the brokerage and legal costs and the ending mortgage balance. The following formula represents the equity residual value.

$$(NI^{11}/R_r) - (b\ (NI^{11}/R_r) - ((1 - P) \times M \times V) = d_r$$

Annual Cash Flow to Equity - The annual cash flow to equity consists of the equity dividend for each projection year plus the equity residual at the end of the tenth year. The following formula represents the annual cash flow to equity.

$$NI^1 - (f \times M \times V) = d_e{}^1$$

$$NI^2 - (f \times M \times V) = d_e{}^2$$

$$NI^{10} - (f \times M \times V) = d_e{}^{10}$$

$$(NI^{11}/R_r) - (b\,(NI^{11}/R_r) - ((1 - P) \times M \times V) = d_r$$

Value of the Equity – If the initial mortgage amount is calculated by multiplying the loan-to-value ratio (M) by the property value (V), then the equity value is one minus the loan-to-value ratio multiplied by the property value. The following formula represents the value of the equity.

$$(1 - M)\,V$$

Discounting the Cash Flow to Equity to the Present Value – The cash flow to equity in each projection year is discounted to the present value at the equity yield rate ($1/S^n$). The sum of these cash flows is the value of the equity (1 - M) V. The following formula represents the calculation of equity as the sum of the discounted cash flows.

$$(d_e{}^1 \times 1/S^1) + (d_e{}^2 \times 1/S^2) + \ldots + (d_e{}^{10} \times 1/S^{10}) + (d_r \times 1/S^{10}) = (1 - M)\,V$$

Combining the Equations: Annual Cash Flow to Equity and Discounting the Cash Flow to Equity to the Present Value – The last step is to arrive at one overall equation that shows that the annual cash flow to equity plus the yearly discounting to the present value equals the value of the equity.

$$((NI^1 - (f \times M \times V))\ 1/S^1) + ((NI^2 - (f \times M \times V))\ 1/S^2) + \ldots$$

$$((NI^{10} - (f \times M \times V))\ 1/S^{10}) +$$

$$(((NI^{11}/R_r) - (b\,(NI^{11}/R_r)) - ((1 - P) \times M \times V))\ 1/S^{10}) = (1 - M)\,V$$

Because the only unknown in this equation is the property's value (V), it can be solved readily.

Ten-Year Projection of Income and Expense – Because the fixed and variable forecast of income and expense is carried out only to the stabilized year, it is necessary to continue the projection to the eleventh year. In most cases, net income before debt service beyond the stabilized year is projected at an assumed inflation rate. By increasing a property's revenue and expenses at the same rate of inflation, net income remains constant as a percentage of total revenue, and the dollar amount escalates at the annual inflation rate. The ten-year forecast of

income and expense illustrates the subject property's net income, which is assumed to increase by 3.0% annually subsequent to the hotel's stabilized year of operation.

The following values are assigned to the variable components for the purposes of this valuation.

SUMMARY OF KNOWN VARIABLES

Annual Net Income	NI	See Ten-Year Forecast
Loan-To-Value Ratio	M	70 %
Interest Rate	*i*	5.50 %
Debt Service Constant	f	0.073690
Equity Yield	Ye	15.5 %
Transaction Costs	b	2.0 %
Annual Constant Required to Amortize the Loan in Ten Years	fp	0.130232
Terminal Capitalization Rate	Rr	9.0 %

The following table illustrates the present worth of a $1 factor at the 15.5% equity yield rate.

PRESENT WORTH OF $1 FACTOR AT THE EQUITY YIELD RATE

Year Ending	Present Worth of $1 Factor at 15.5%
2018/19	0.865777
2019/20	0.749569
2020/21	0.648960
2021/22	0.561854
2022/23	0.486441
2023/24	0.421149
2024/25	0.364621
2025/26	0.315680
2026/27	0.273309
2027/28	0.236624

Using these known variables, the following intermediary calculations must be made before applying the simultaneous valuation formula. The fraction of the loan paid off during the projection period is calculated as follows.

P = (0.07369 - 0.0550) / (0.13023 - 0.0550) = 0.248440

The annual debt service is calculated as f x M x V.

(f x M x V)= 0.07369 x 0.70 x V = (0.05158)V

Inserting the known variables into the hotel valuation formula produces the following.

(2,332,000 - 0.05158 V) x 0.8658 +
(2,796,000 - 0.05158 V) x 0.74961 +
(2,968,000 - 0.05158 V) x 0.64901 +
(3,046,000 - 0.05158 V) x 0.56192 +
(3,137,000 - 0.05158 V) x 0.48651 +
(3,232,000 - 0.05158 V) x 0.42122 +
(3,329,000 - 0.05158 V) x 0.36469 +
(3,429,000 - 0.05158 V) x 0.31575 +
(3,531,000 - 0.05158 V) x 0.27338 +
(3,638,000 - 0.05158 V) x 0.23669 +

(((3,747,000 / 0.090) - (0.020 x (3,747,000 / 0.090)) -

((1 - 0.248440) x 0.7 x V)) x 0.23669) = (1 - 0.7)V

Like terms are combined as follows.

$24,420,645 - 0.378547V = (1 - 0.70)V
$24,420,645 = 0.67855V
V = $24,420,645 / 0.67855
V = $35,989,607

Total Property Value as Indicated by the Income Capitalization Approach (Say) = $36,000,000

Mr. George Xu
35-06 Leavit St., Unit #CF-A
Flushing, NY 11354

E-Mail: georgexu88@yahoo.com

Re: Hotel / Apartment Hotel Development
64-06 Queens Blvd.
Woodside, NY
P. 21422

Dear George:

Thank you for taking time to review your project with me. It is my pleasure to submit this proposal for the architectural and engineering services for the above referenced project.

(b)(4) As per our meeting earlier, I have prepared this proposal for your review. I hope the followings will reflect your needs and concerns.

web://www.raymondchanarchitect.com • email:info@raymondchanarchitect.com

C.C.: IB (PROPOSED)

LOT SIZE:
16,050.2 SF OF WHICH
C2-3/R7X DISTRICT: 13,493 SF (84.1%)
R4-1 DISTRICT: 2,557.2 SF (15.9%)

USE REGULATIONS:

22-12/32-15
USE GROUP 2 PERMITTED AS-OF-RIGHT
USE GROUP 4 PERMITTED AS-OF-RIGHT

BULK REGULATIONS - IN INCLUSIONARY HOUSING DESIGNATED AREAS:

SPECIAL PROVISIONS FOR ZONING LOTS DIVIDED BY DISTRICT BOUNDARIES
77-11
THE USE REGULATIONS APPLICABLE TO THE DISTRICT IN WHICH MORE THAN 50% OF THE LOT AREA OF THE ZONING LOT IS LOCATED MAY APPLY TO THE ENTIRE ZONING LOT, PROVIDED THAT THE DISTANCE DO NOT EXCEED 25 FEET.
WHENEVER THE USE REGULATIONS ARE SO APPLIED, THE DISTRICT BOUNDARY MAY BE ASSUMED TO BE RELOCATED ACCORDINGLY, AND THE BULK, OFF-STREET PARKING AND LOADING, AND ALL OTHER REGULATIONS APPLYING TO SUCH EXPANDED DISTRICT SHALL APPLY TO THE ENTIRE ZONING LOT.

MAX. LOT COVERAGE
23-145
MAXIMUM LOT COVERAGE IN R7X (CORNER LOT) = 80%
MAX. PERMITTED LOT COVERAGE = 10,077 x80% =8,061.6 SF
PROPOSED LOT COVERAGE =6553 /10,077 =65%<80% o.k.

MAXIMUM LOT COVERAGE IN R7X (INTERIOR LOT) =70%
MAX. PERMITTED LOT COVERAGE = 5,973.2 x70% =4,181.24 SF
PROPOSED LOT COVERAGE =1872 / 5973.2 =31.3%<70% o.k.

23-942 MAX FLOOR AREA
MAX. FLOOR AREA RATIO FOR Q.H. = 3.75
MAX. PERMITTED FLOOR AREA = 16,050.2x3.75 =60,188.25 SF
PROPOSED FLOOR AREA = 28,529 SF < 60,188.25 SF o.k.
PROPOSED FAR = 1.78 < 3.75 o.k.

33-121
MAX. FLOOR AREA RATIO FOR COMMERCIAL = 2.0
MAX. PERMITTED FLOOR AREA = 32,100.4 SF
PROPOSED FLOOR AREA = 31,640 SF < 32,100.4 SF o.k.
PROPOSED FAR = 1.97 < 2.0 o.k.

MAX. FLOOR AREA RATIO FOR ENTIRE BUILDING = 3.75
MAX. PERMITTED FLOOR AREA FOR ENTIRE BUILDING = 60,188.25 SF
PROPOSED FLOOR AREA = 60,169 SF < 60,188.25 SF o.k.
PROPOSED FAR = 3.75 < 3.75 o.k.

DWELLING FACTORS
23-22
DWELLING FACTOR = 680
= (LOT AREA)x(MAX. FAR-ACTUAL COMM. FAR)/FACTOR
= 16050.2 x (3.75-1.97) /680
= 16050.2x1.78 / 680 = 42 UNITS ALLOWED
PROPOSED 42 UNITS < 42 o.k.

23-693 (a)
NOT EXCEED A HEIGHT OF 35' IF THE DISTRICT IS WITHIN 25' OF R4 DISTRICT

YARD REGULATIONS
35-51
NO FRONT YARD REQUIRED

35-53
NO REAR YARD REQUIRED FOR CORNER LOT

33-261 BEYOND 100' OF A STREET LINE
20' OF REAR YARD REQUIRED

33-291 REQUIRED YARD ALONG DISTRICT BOUNDARY
A SIDE YARD OF 8' WIDE ALONG BOUNDARY

STREET WALL LOCATION AND HEIGHT AND SETBACK REGULATIONS

123-662
(b) STREET WALL LOCATION:
AT LEAST 70% OF THE AGGREGATE WIDTH OF THE STREET WALLS SHALL BE LOCATED WITHIN 8' OF THE STREET LINE AND SHALL EXTEND TO AT LEAST THE MIN BASE HEIGHT, THE REMAINING 30% OF STREET WALLS MAY BE LOCATED BEYOND 8' OF THE STREET LINE.

FOR ZONING LOTS BOUNDED BY MORE THAN ONE STREET LINE, THESE STREET WALL SHALL BE MANDATORY ALONG ONLY ONE STREET LINE

(c) SETBACK
AT A HEIGHT NOT LOWER THAN THE MIN. BASE HEIGHT OR HIGHER THAN THE MAX BASE HEIGHT, AT LEAST 10' SETBACK FROM THE STREET WALL SHALL BE PROVIDED ON A WIDE STREET, 15' SHALL BE PROVIDED ON A NARROW STREET

C2 MAPPED IN R7X ON A WIDE STREET AND WITHIN A DISTANCE OF 100' FROM A WIDE STREET:
MIN. BASE HEIGHT = 60 FEET
MAX. BASE HEIGHT = 85 FEET
MAX. BUILDING HEIGHT = 125 FEET

PROPOSED BUILDING HEIGHT =83'-11"

PARKING COMPUTATIONS

Re: Hotel / Apartment Hotel Development
64-06 Queens Blvd.
Woodside, NY
P. 21422

Dear George:

Thank you for taking time to review your project with me. It is my pleasure to submit this proposal for the architectural and engineering services for the above referenced project.

(b)(4)

As per our meeting earlier, I have prepared this proposal for your review. I hope the followings will reflect your needs and concerns.

LOT SIZE:
16,050.2 SF OF WHICH
C2-3/R7X DISTRICT: 13,493 SF (84.1%)
R4-1 DISTRICT: 2,557.2 SF (15.9%)

USE REGULATIONS:

22-12/32-15
USE GROUP 2 PERMITTED AS-OF-RIGHT
USE GROUP 4 PERMITTED AS-OF-RIGHT

BULK REGULATIONS - IN INCLUSIONARY HOUSING DESIGNATED AREAS:

SPECIAL PROVISIONS FOR ZONING LOTS DIVIDED BY DISTRICT BOUNDARIES
77-11
THE USE REGULATIONS APPLICABLE TO THE DISTRICT IN WHICH MORE THAN 50% OF THE LOT AREA OF THE ZONING LOT IS LOCATED MAY APPLY TO THE ENTIRE ZONING LOT, PROVIDED THAT THE DISTANCE DO NOT EXCEED 25 FEET.
WHENEVER THE USE REGULATIONS ARE SO APPLIED, THE DISTRICT BOUNDARY MAY BE ASSUMED TO BE RELOCATED ACCORDINGLY, AND THE BULK, OFF-STREET PARKING AND LOADING, AND ALL OTHER REGULATIONS APPLYING TO SUCH EXPANDED DISTRICT SHALL APPLY TO THE ENTIRE ZONING LOT.

MAX. LOT COVERAGE
23-145
MAXIMUM LOT COVERAGE IN R7X (CORNER LOT) = 80%
MAX. PERMITTED LOT COVERAGE = 10,077 x80% =8,061.6 SF
PROPOSED LOT COVERAGE =6553 /10,077 =65%<80% o.k.

MAXIMUM LOT COVERAGE IN R7X (INTERIOR LOT) =70%
MAX. PERMITTED LOT COVERAGE = 5,973.2 x70% =4,181.24 SF
PROPOSED LOT COVERAGE =1872 / 5973.2 =31.3%<70% o.k.

23-942 MAX FLOOR AREA
MAX. FLOOR AREA RATIO FOR Q.H. = 3.75
MAX. PERMITTED FLOOR AREA = 16,050.2x3.75 =60,188.25 SF
PROPOSED FLOOR AREA = 28,529 SF < 60,188.25 SF o.k.
PROPOSED FAR = 1.78 < 3.75 o.k.

33-121
MAX. FLOOR AREA RATIO FOR COMMERCIAL = 2.0
MAX. PERMITTED FLOOR AREA = 32,100.4 SF
PROPOSED FLOOR AREA = 31,640 SF < 32,100.4 SF o.k.
PROPOSED FAR = 1.97 < 2.0 o.k.

MAX. FLOOR AREA RATIO FOR ENTIRE BUILDING = 3.75
MAX. PERMITTED FLOOR AREA FOR ENTIRE BUILDING = 60,188.25 SF
PROPOSED FLOOR AREA = 60,169 SF < 60,188.25 SF o.k.
PROPOSED FAR = 3.75 < 3.75 o.k.

DWELLING FACTORS
23-22
DWELLING FACTOR = 680
= (LOT AREA)x(MAX. FAR-ACTUAL COMM. FAR)/FACTOR
= 16050.2 x (3.75-1.97) /680
= 16050.2x1.78 / 680 = 42 UNITS ALLOWED
PROPOSED 42 UNITS < 42 o.k.

23-693 (a)
NOT EXCEED A HEIGHT OF 35' IF THE DISTRICT IS WITHIN 25' OF R4 DISTRICT

YARD REGULATIONS
35-51
NO FRONT YARD REQUIRED

35-53
NO REAR YARD REQUIRED FOR CORNER LOT

33-261 BEYOND 100' OF A STREET LINE
20' OF REAR YARD REQUIRED

33-291 REQUIRED YARD ALONG DISTRICT BOUNDARY
A SIDE YARD OF 8' WIDE ALONG BOUNDARY

STREET WALL LOCATION AND HEIGHT AND SETBACK REGULATIONS

123-662
(b) STREET WALL LOCATION:
AT LEAST 70% OF THE AGGREGATE WIDTH OF THE STREET WALLS SHALL BE LOCATED WITHIN 8' OF THE STREET LINE AND SHALL EXTEND TO AT LEAST THE MIN BASE HEIGHT, THE REMAINING 30% OF STREET WALLS MAY BE LOCATED BEYOND 8' OF THE STREET LINE.

FOR ZONING LOTS BOUNDED BY MORE THAN ONE STREET LINE, THESE STREET WALL SHALL BE MANDATORY ALONG ONLY ONE STREET LINE

(c) SETBACK
AT A HEIGHT NOT LOWER THAN THE MIN. BASE HEIGHT OR HIGHER THAN THE MAX BASE HEIGHT, AT LEAST 10' SETBACK FROM THE STREET WALL SHALL BE PROVIDED ON A WIDE STREET, 15' SHALL BE PROVIDED ON A NARROW STREET

C2 MAPPED IN R7X ON A WIDE STREET AND WITHIN A DISTANCE OF 100' FROM A WIDE STREET:
MIN. BASE HEIGHT = 60 FEET
MAX. BASE HEIGHT = 85 FEET
MAX. BUILDING HEIGHT = 125 FEET

PROPOSED BUILDING HEIGHT =83'-11"

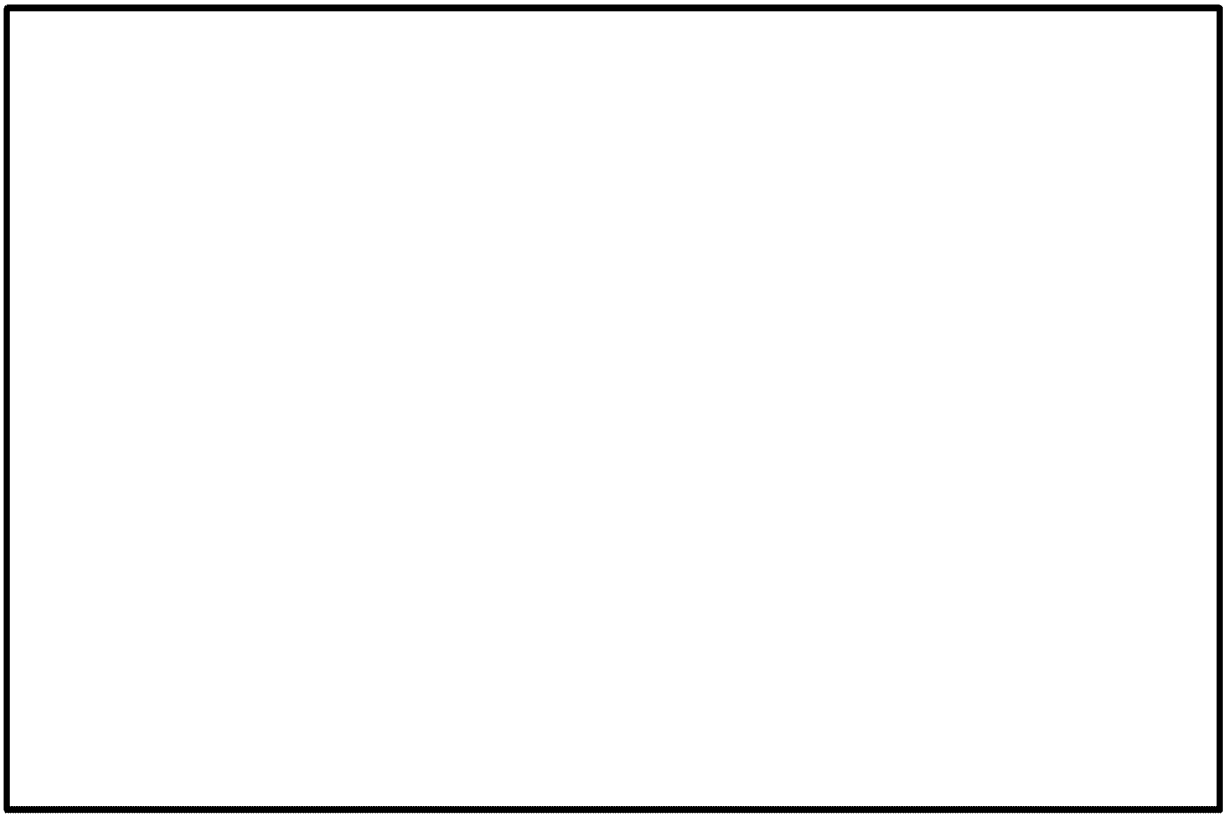
Re: Structural and SOE Design for the 6410 Queens BLVD Project

Dear George,

Thank you for asking us to prepare this proposal for providing structural design service for the subject project. Per the information we have received, we note that the subject project is to build a 7 story hotel building with cellar and subcellar on a lot approximately 16,000 sq ft. The proposed total construction area is approximately 100,000 sq ft. As per our discussion, we'll provide the following engineering services for this project:

(b)(4)



Times Buildings PC
ENGINEERING SERVICES 时代工程师事务所

8534 Grand Ave 2nd Fl Elmhurst, NY 11373
tel. 718 502 9631 fax 718 228 7348

www.tbes.us

Enclosed please also find our typical services and general conditions for your reference. If this proposal meets your approval, please sign and send a copy to our office with the deposit so that we can proceed accordingly.

Should you have any questions, please let me know.

Thank you very much,

Zhou Xu, PhD, SE, PE, LEED® AP

Re: Engineering Design Services
Holiday Inn -64-06 Queens Blvd., Queens, NY

Dear George:

Thank you for the opportunity to provide engineering services for your project.

Enclosed is an agreement that reflects our understanding of your requirements.

Please review the agreement and if it is acceptable, fax and mail one copy with your signature, indicating acceptance. Your signed acceptance is required to allow us to proceed with the project.

We look forward to working with you on this project.

Very truly yours,

EJC ENGINEERING, PLLC

Eric Chang, P.E.

Re: Preliminary Geotechnical Investigation Report
Proposed 8- story Building
64-10 Queens Boulevard
Queens, NY 11377
GTC Job No.: QNBV115

Dear Mr. Xu:

This report presents the results of a preliminary geotechnical investigation performed by Geo Tech Consultants LLC for the above referenced project. The work was performed in accordance with our proposal dated February 18, 2015 and your subsequent authorization.

The scope of our service performed for this phase of the investigation included:

- Drilling and full-time inspection of three (3) test borings;
- Performance of engineering evaluation to determine the stratification and physical characteristics of the subsoils, and to develop recommendations for the design and construction of foundations for support of the proposed building;
- Preparation of a written report complete with test data, analysis, and recommendations.

1 PROJECT AND SITE DESCRIPTION

The subject property, known as 64-10 Queens Blvd of Queens, New York, is located on the southeast quadrant of the intersection of Queens Blvd and 64th Street.

The site, also known as Lot 32 of Block 2325, measures 141.15' along Queens Boulevard and 120.92' along 64th Street. Site terrain slopes from north to south with highest elevation along Queens Blvd (average elevation 49.85') and lowest at the southwest corner (average elevation around 43').

Currently a high one story building occupies the eastern 100' of the site, leaving the western end open for parking. The property is adjoined intermittently by 3-story and 1-story buildings to the east and a 2-story brick building to the south.

It is our understanding that the project consists of demolishing the existing 1-story building and replacing it with a new 8-story mixed-use building with a cellar and a sub-cellar. The depth of the sub-cellar is tentatively set at a depth of about 19 ft below the sidewalk of Queens Blvd.

As the project is still in the conceptual design stage, no structural loading information regarding the proposed building was available at the time this report was prepared.

2 FIELD EXPLORATION

To provide preliminary foundation assessment, three test borings labeled as B-1, B-2 and B-3 were installed. The boring was performed by Craig Geotechnical Drilling Corp of Mays Landing, New Jersey on March 6th and 9th, 2105 and inspected by GTC's professional engineering staff. The as-drilled boring location is shown on drawing G-001, which is attached at the end of this report.

Borings B-1, B-2 and B-3 were drilled using mud rotary method to respective depth of 102', 52' and 52' below existing grade. Soils encountered in the boring were generally sampled at five (5) ft interval throughout except for B-1 where continuous samples were taken for the first 12' and at five (5) ft intervals afterwards. Each soil sample was extracted using a Standard Split-Spoon sampler by performing a Standard Penetration Test (SPT) in accordance with ASTM D 1586.

During drilling operation, extracted soil samples were visually examined and classified by our field engineer. The retrieved soil samples were then placed in sealed glass jars and later returned to driller's shop for storage.

Detailed descriptions of the soil samples encountered in the test borings were documented in the boring logs, which are presented on drawing G-001.

3 SUBSURFACE CONDITIONS

The following provides a general description of the soil profile inferred from the test borings. While the borings indicate that the subsurface conditions appear to be relatively uniform across the site, it should be recognized that the number of borings was small compared to the size of the site, and that the existence of anomalies cannot be precluded.

3.1 Soil Profile

All three borings encountered approximately 2' of miscellaneous fill, followed by glacial sands to the termination depth of the borings.

The miscellaneous fill was described to consist mostly of sands with concrete and asphalt fragments, which is a NYC Class 7 material. The fill registered medium dense to very dense compact condition

The miscellaneous fill was followed by a glacial deposit that extended down to the maximum depth of the borings. The glacial deposit consists predominantly of coarse-medium-fine sands with trace to some clay, silt and gravel, consistent with SP/SM Group of the USCS (Unified Soil Classification System).

The glacial sands registered mostly medium dense compact condition from 2'-75', which matches NYC Class 3b material, and dense compact condition thereafter, which matches NYC Class 3a material. There were exceptions found in B-1 and B-2, where glacial sands between 25' and 30' of depth registered loose compact condition, matching NYC Class 6 material.

3.2 Groundwater

Groundwater was observed at depths between 40'-45' below grade, corresponding to elevations around 4'-5'.

It should be pointed out that groundwater table is known to fluctuate with seasonal, tidal, and climatic conditions.

4. CONCLUSIONS AND RECOMMENDATIONS

4.1 Foundation Analysis and Evaluation

The borings depicts a general profile of 2' of miscellaneous fill, followed by glacial sand deposit to the termination depth of the boring. Groundwater table was observed at a depth of 40'-45' below existing grade.

4.2 Foundation supporting Schemes and Design Criteria

4.2.1 Foundation Types

Our analysis of the boring data obtained from the preliminary borings suggests that the subsoil conditions as it revealed are marginally suitable for the use of shallow spread footing for support of the proposed building.

Our discussion and recommendations regarding various aspects of the proposed construction are presented below.

4.2.1.1 Mat Footing on modified subgrade

Our analysis suggests that it is possible to support the proposed new building on mat footing provided the mat footing is designed and installed in accordance with the following recommendations and limitations.

The mat footings should be established on at least 1' of natural ¾" crushed stone, which shall be wrapped around with a geofabric such as Mirafi 500X or equivalent.

Mat footings supporting on modified subgrade as described above may be designed for a maximum capacity up to 2.0 tsf. If a modulus of subgrade reaction is required for mat footing analysis, then a moderate value up to 50 pci may be considered for use.

Prior to receiving geofabric and crushed stone, the undercut footing subgrade shall be proofrolled with a heavy vibratory roller under the guidance and observation of a qualified geotechnical engineer. At the discretion of the inspecting geotechnical engineer, any unsuitable bearing materials found at the undercut subgrade shall be removed and replaced with controlled compacted fill or additional ¾" crushed stone.

Mat footings designed and installed in accordance with the above recommendations are expected to yield settlements between ¾" and 1 ½", 50% of which would be complete upon completion of the construction.

If the above estimated settlements are deemed intolerable to the building system proposed, then deep foundation systems such as micropiles shall be considered.

4.2.1.2 Micropiles (drilled pile)

Micropiles are small diameter (generally ranges between 8 and 14 inches) piles that are installed by drilling, which generates little vibration and noise. Micropiles derive their bearing capacity from their friction against the surrounding soil.

Based on boring logs obtained during this investigation, our analysis suggests that micropiles with diameter of 8" - 14" can achieve compressive capacities ranging from 30 tons to 150 tons when properly designed and installed. Optimal pile capacity shall be determined by project engineer based on the loading pattern and magnitude requirements.

Micropiles require detailed design to satisfy both the geotechnical and structural requirements as stipulated in the NYC Code. They are generally contracted out as performance specification with contractor responsible for design, installation and quality assurance.

Contractor shall submit design submittal to engineer of record for review and approval prior to installation.

For estimation of geotechnical capacity of micropiles, a maximum allowable skin-resistance up to 10 psi may be considered for pile section embedded in NYC Class 3b material, and 14 psi for section embedded in NYC Class 3a material. Steel casing shall be provided in the upper section above the fixity of the pile.

Micropiles are friction piles, which require load tests to verify its design compressive capacity according to NYC Building Code.

The uplift capacity of a micropile pile depends upon its size and penetration depth. For preliminary estimation purpose, one can assume a value up to 50% of the maximum allowable compressive capacity it achieved.

In regards to lateral resistance of a micropile, the NYC Code allows up to 1 ton maximum per pile without triggering the requirement for lateral load tests.

4.2.2 Seismic Design Considerations

Based on the boring data obtained from this investigation and in accordance with the new NYC Building Code, the site can be considered as site Class D for seismic design purpose. Refer to NYC Building Code for additional seismic-related criteria for foundation design.

4.2.3 Liquefaction Potential

Using the liquefaction assessment diagram (Figure 1813.1) provided in the NYC Building Code, the site soil is deemed liquefaction unlikely.

4.3 Cellar slabs and walls

4.3.1 Design groundwater level

Groundwater table was observed at depths of about 40'-45' below existing grade (corresponding to elevations 4'-5'). To account for seasonal variation, we suggest that design groundwater level be assumed at a depth not to be deeper than 40' below sidewalk, or elevation 7'-8', which should have minimal impact to the foundation and cellar design.

4.3.2 Sub-cellar slab

It is our opinion that the proposed sub-cellar slab can be designed and constructed as a slab-on-grade bearing on 1' of ¾" crushed stone course over competent glacial sands.

Prior to receiving crushed stone, the slab subgrade should be subject to proofrolling using a vibratory roller and under the observation of a qualified geotechnical engineer. At the

discretion of the inspecting soil engineer, any soft areas detected during the proofrolling should be removed and replaced with controlled compacted fill (see section 5.3 for fill material and placement requirements). Qualified ¾" crushed stone can be used in place of control fill if so desired or directed by the inspecting engineer.

4.3.3 Lateral Earth Pressures

Permanent walls-below-grade should be designed to withstand long-term, at rest equivalent fluid pressures of 60 pounds per cubic foot (pcf) above design groundwater level and 90 pcf below groundwater level.

Temporary walls, such as excavation shoring, if required, should be designed to withstand equivalent fluid pressure of 40 pcf above groundwater level and 80 pcf below groundwater level.

Backfill against the basement wall should consist of sand and gravel with no more than 10% fines (minus No. 200 sieve size). The fill should be placed in horizontal lifts and each lift should be compacted to at least 95% of the maximum dry density as determined in accordance with ASTM D1557.

4.3.4 Foundation drainage, Under-slab drainage, and Waterproofing

Despite the relatively deep-seated groundwater table, we recommend that foundation drainage be installed around the cellar foundation, where applicable, to ensure free hydrostatic pressure behind the cellar wall. Typical foundation drainage system can consist of 6" diameter filter-lined, perforated PVC pipe covered with 6" of ¾" crushed stone in all directions. Water collected in the foundation drainage system should be discharged into ejector pits where it can be pumped out and discharged into approved facilities.

Under-slab drainage system is optional but not required provided the cellar slab is supported on at least 12" of ¾" crushed stone. Typical under-slab drainage system, if used, can consist of perforated pipe looping within the under-slab crushed stone course at spacing not greater than 25'. The water collected in the perforated pipe can be directed to sump pit or ejector pits where it can be pumped out and discharged into approved facilities.

Waterproofing the underside of the cellar slab and the exterior of the cellar walls is optional but not required, subject to the discretion of the design architect and engineer. As a minimum, though, the cellar slab should be provided with a vapor barrier and the cellar wall dam proofed.

4.4 Construction Dewatering

Construction dewatering is not expected during the installation of foundation. However, perched water and/or surface runoff condition could develop during the course of construction. Provisions should be made to provide sump pumping capability on-site during construction to control surface water runoff.

4.5 Underpinning

The scope of the preliminary investigation did not include assessment of underpinning requirement, which can be determined in the later investigation, if requested.

5. CONSTRUCTION MONITORING

5.1 Pre-construction Survey

It is strongly recommended that a pre-construction survey be conducted to document the existing conditions of the adjacent buildings, structures or sidewalks prior to commencement of any construction activities. The conditions of the adjacent structures/facilities/slabs should also be monitored periodically during the course of construction.

5.2 Protection of Adjacent Structures and Sidewalk

The excavation of the proposed cellar and footings may require underpinning and shoring of the existing adjacent footings, which, if determined to be required, shall be designed by a professional engineer engaged by the contractor. The contractor shall submit shop drawings to the project engineer for review and approval prior to installation. The installation shall be subject to special inspection by a qualified engineer in accordance with NYC Building Code.

5.3 Filling and Backfilling

Filling and backfilling should utilize qualified fill materials meeting the grading requirements for control fill as per NYC Building Code. Control fill should be placed in 12-inch loose lifts and each lift should be compacted to at least 95% of its maximum dry density as determined in accordance with ASTM D1557.

6. LIMITATION AND ADDITIONAL BORINGS

The conclusions and recommendations contained in this report are based on the subsurface data obtained during the preliminary investigation and on the details stated in this report. Should conditions be encountered which differ specifically from those stated in this report, we should be notified immediately so that our recommendations may be reviewed and/or revised, if necessary.

It is necessary to install additional borings after the existing buildings have been demolished in order to satisfy the NYC Building Code with respect to site investigation. The additional borings will serve to ascertain the initial boring findings and recommendations.

7. CONSTRUCTION CONSULTATION AND INSPECTION

Due to the nature of the soils and subsurface conditions at this site and the recommendations set forth herein, consultation and inspection services by a qualified soil engineer are recommended for the following:

1. Preparation of the site, including clearing, excavation of basement, and initial proofrolling and compaction of the in-situ soils.

2. Placement of all controlled backfill and/or fill, if any.

3. Pre-construction survey of adjacent structures.

4. Cellar excavation and footing subgrade inspection.

We trust the above information will allow you to proceed with the design and construction of the proposed mixed-use building.

We thank you for the opportunity of providing this service to you. Should you have any questions regarding this report, or if we can be of further assistance, please do not hesitate to contact us.

Respectfully Submitted
Geo Tech Consultants LLC

Steve J. J. Lin, P.E.

Re: Structural and SOE Design for the 6410 Queens BLVD Project

Dear George,

Thank you for asking us to prepare this proposal for providing structural design service for the subject project. Per the information we have received, we note that the subject project is to build a 7 story hotel building with cellar and subcellar on a lot approximately 16,000 sq ft. The proposed total construction area is approximately 100,000 sq ft. As per our discussion, we'll provide the following engineering services for this project:

Re: Engineering Design Services
Holiday Inn -64-06 Queens Blvd., Queens, NY

Dear George:

Thank you for the opportunity to provide engineering services for your project.

Enclosed is an agreement that reflects our understanding of your requirements.

Please review the agreement and if it is acceptable, fax and mail one copy with your signature, indicating acceptance. Your signed acceptance is required to allow us to proceed with the project.

We look forward to working with you on this project.

Very truly yours,

EJC ENGINEERING, PLLC

Eric Chang, P.E.

Re: Preliminary Geotechnical Investigation Report
Proposed 8- story Building
64-10 Queens Boulevard
Queens, NY 11377
GTC Job No.: QNBV115

Dear Mr. Xu:

This report presents the results of a preliminary geotechnical investigation performed by Geo Tech Consultants LLC for the above referenced project. The work was performed in accordance with our proposal dated February 18, 2015 and your subsequent authorization.

The scope of our service performed for this phase of the investigation included:

- Drilling and full-time inspection of three (3) test borings;
- Performance of engineering evaluation to determine the stratification and physical characteristics of the subsoils, and to develop recommendations for the design and construction of foundations for support of the proposed building;
- Preparation of a written report complete with test data, analysis, and recommendations.

1 PROJECT AND SITE DESCRIPTION

The subject property, known as 64-10 Queens Blvd of Queens, New York, is located on the southeast quadrant of the intersection of Queens Blvd and 64th Street.

The site, also known as Lot 32 of Block 2325, measures 141.15' along Queens Boulevard and 120.92' along 64th Street. Site terrain slopes from north to south with highest elevation along Queens Blvd (average elevation 49.85') and lowest at the southwest corner (average elevation around 43').

Currently a high one story building occupies the eastern 100' of the site, leaving the western end open for parking. The property is adjoined intermittently by 3-story and 1-story buildings to the east and a 2-story brick building to the south.

It is our understanding that the project consists of demolishing the existing 1-story building and replacing it with a new 8-story mixed-use building with a cellar and a sub-cellar. The depth of the sub-cellar is tentatively set at a depth of about 19 ft below the sidewalk of Queens Blvd.

As the project is still in the conceptual design stage, no structural loading information regarding the proposed building was available at the time this report was prepared.

2 FIELD EXPLORATION

To provide preliminary foundation assessment, three test borings labeled as B-1, B-2 and B-3 were installed. The boring was performed by Craig Geotechnical Drilling Corp of Mays Landing, New Jersey on March 6th and 9th, 2105 and inspected by GTC's professional engineering staff. The as-drilled boring location is shown on drawing G-001, which is attached at the end of this report.

Borings B-1, B-2 and B-3 were drilled using mud rotary method to respective depth of 102', 52' and 52' below existing grade. Soils encountered in the boring were generally sampled at five (5) ft interval throughout except for B-1 where continuous samples were taken for the first 12' and at five (5) ft intervals afterwards. Each soil sample was extracted using a Standard Split-Spoon sampler by performing a Standard Penetration Test (SPT) in accordance with ASTM D 1586.

During drilling operation, extracted soil samples were visually examined and classified by our field engineer. The retrieved soil samples were then placed in sealed glass jars and later returned to driller's shop for storage.

Detailed descriptions of the soil samples encountered in the test borings were documented in the boring logs, which are presented on drawing G-001.

3 SUBSURFACE CONDITIONS

The following provides a general description of the soil profile inferred from the test borings. While the borings indicate that the subsurface conditions appear to be relatively uniform across the site, it should be recognized that the number of borings was small compared to the size of the site, and that the existence of anomalies cannot be precluded.

3.1 Soil Profile

All three borings encountered approximately 2' of miscellaneous fill, followed by glacial sands to the termination depth of the borings.

The miscellaneous fill was described to consist mostly of sands with concrete and asphalt fragments, which is a NYC Class 7 material. The fill registered medium dense to very dense compact condition

The miscellaneous fill was followed by a glacial deposit that extended down to the maximum depth of the borings. The glacial deposit consists predominantly of coarse-medium-fine sands with trace to some clay, silt and gravel, consistent with SP/SM Group of the USCS (Unified Soil Classification System).

The glacial sands registered mostly medium dense compact condition from 2'-75', which matches NYC Class 3b material, and dense compact condition thereafter, which matches NYC Class 3a material. There were exceptions found in B-1 and B-2, where glacial sands between 25' and 30' of depth registered loose compact condition, matching NYC Class 6 material.

3.2 Groundwater

Groundwater was observed at depths between 40'-45' below grade, corresponding to elevations around 4'-5'.

It should be pointed out that groundwater table is known to fluctuate with seasonal, tidal, and climatic conditions.

4. CONCLUSIONS AND RECOMMENDATIONS

4.1 Foundation Analysis and Evaluation

The borings depicts a general profile of 2' of miscellaneous fill, followed by glacial sand deposit to the termination depth of the boring. Groundwater table was observed at a depth of 40'-45' below existing grade.

4.2 Foundation supporting Schemes and Design Criteria

4.2.1 Foundation Types

Our analysis of the boring data obtained from the preliminary borings suggests that the subsoil conditions as it revealed are marginally suitable for the use of shallow spread footing for support of the proposed building.

Our discussion and recommendations regarding various aspects of the proposed construction are presented below.

4.2.1.1 Mat Footing on modified subgrade

Our analysis suggests that it is possible to support the proposed new building on mat footing provided the mat footing is designed and installed in accordance with the following recommendations and limitations.

The mat footings should be established on at least 1' of natural ¾" crushed stone, which shall be wrapped around with a geofabric such as Mirafi 500X or equivalent.

Mat footings supporting on modified subgrade as described above may be designed for a maximum capacity up to 2.0 tsf. If a modulus of subgrade reaction is required for mat footing analysis, then a moderate value up to 50 pci may be considered for use.

Prior to receiving geofabric and crushed stone, the undercut footing subgrade shall be proofrolled with a heavy vibratory roller under the guidance and observation of a qualified geotechnical engineer. At the discretion of the inspecting geotechnical engineer, any unsuitable bearing materials found at the undercut subgrade shall be removed and replaced with controlled compacted fill or additional ¾" crushed stone.

Mat footings designed and installed in accordance with the above recommendations are expected to yield settlements between ¾" and 1 ½", 50% of which would be complete upon completion of the construction.

If the above estimated settlements are deemed intolerable to the building system proposed, then deep foundation systems such as micropiles shall be considered.

4.2.1.2 Micropiles (drilled pile)

Micropiles are small diameter (generally ranges between 8 and 14 inches) piles that are installed by drilling, which generates little vibration and noise. Micropiles derive their bearing capacity from their friction against the surrounding soil.

Based on boring logs obtained during this investigation, our analysis suggests that micropiles with diameter of 8" - 14" can achieve compressive capacities ranging from 30 tons to 150 tons when properly designed and installed. Optimal pile capacity shall be determined by project engineer based on the loading pattern and magnitude requirements.

Micropiles require detailed design to satisfy both the geotechnical and structural requirements as stipulated in the NYC Code. They are generally contracted out as performance specification with contractor responsible for design, installation and quality assurance.

Contractor shall submit design submittal to engineer of record for review and approval prior to installation.

For estimation of geotechnical capacity of micropiles, a maximum allowable skin-resistance up to 10 psi may be considered for pile section embedded in NYC Class 3b material, and 14 psi for section embedded in NYC Class 3a material. Steel casing shall be provided in the upper section above the fixity of the pile.

Micropiles are friction piles, which require load tests to verify its design compressive capacity according to NYC Building Code.

The uplift capacity of a micropile pile depends upon its size and penetration depth. For preliminary estimation purpose, one can assume a value up to 50% of the maximum allowable compressive capacity it achieved.

In regards to lateral resistance of a micropile, the NYC Code allows up to 1 ton maximum per pile without triggering the requirement for lateral load tests.

4.2.2 Seismic Design Considerations

Based on the boring data obtained from this investigation and in accordance with the new NYC Building Code, the site can be considered as site Class D for seismic design purpose. Refer to NYC Building Code for additional seismic-related criteria for foundation design.

4.2.3 Liquefaction Potential

Using the liquefaction assessment diagram (Figure 1813.1) provided in the NYC Building Code, the site soil is deemed liquefaction unlikely.

4.3 Cellar slabs and walls

4.3.1 Design groundwater level

Groundwater table was observed at depths of about 40'-45' below existing grade (corresponding to elevations 4'-5'). To account for seasonal variation, we suggest that design groundwater level be assumed at a depth not to be deeper than 40' below sidewalk, or elevation 7'-8', which should have minimal impact to the foundation and cellar design.

4.3.2 Sub-cellar slab

It is our opinion that the proposed sub-cellar slab can be designed and constructed as a slab-on-grade bearing on 1' of ¾" crushed stone course over competent glacial sands.

Prior to receiving crushed stone, the slab subgrade should be subject to proofrolling using a vibratory roller and under the observation of a qualified geotechnical engineer. At the

discretion of the inspecting soil engineer, any soft areas detected during the proofrolling should be removed and replaced with controlled compacted fill (see section 5.3 for fill material and placement requirements). Qualified ¾" crushed stone can be used in place of control fill if so desired or directed by the inspecting engineer.

4.3.3 Lateral Earth Pressures

Permanent walls-below-grade should be designed to withstand long-term, at rest equivalent fluid pressures of 60 pounds per cubic foot (pcf) above design groundwater level and 90 pcf below groundwater level.

Temporary walls, such as excavation shoring, if required, should be designed to withstand equivalent fluid pressure of 40 pcf above groundwater level and 80 pcf below groundwater level.

Backfill against the basement wall should consist of sand and gravel with no more than 10% fines (minus No. 200 sieve size). The fill should be placed in horizontal lifts and each lift should be compacted to at least 95% of the maximum dry density as determined in accordance with ASTM D1557.

4.3.4 Foundation drainage, Under-slab drainage, and Waterproofing

Despite the relatively deep-seated groundwater table, we recommend that foundation drainage be installed around the cellar foundation, where applicable, to ensure free hydrostatic pressure behind the cellar wall. Typical foundation drainage system can consist of 6" diameter filter-lined, perforated PVC pipe covered with 6" of ¾" crushed stone in all directions. Water collected in the foundation drainage system should be discharged into ejector pits where it can be pumped out and discharged into approved facilities.

Under-slab drainage system is optional but not required provided the cellar slab is supported on at least 12" of ¾" crushed stone. Typical under-slab drainage system, if used, can consist of perforated pipe looping within the under-slab crushed stone course at spacing not greater than 25'. The water collected in the perforated pipe can be directed to sump pit or ejector pits where it can be pumped out and discharged into approved facilities.

Waterproofing the underside of the cellar slab and the exterior of the cellar walls is optional but not required, subject to the discretion of the design architect and engineer. As a minimum, though, the cellar slab should be provided with a vapor barrier and the cellar wall dam proofed.

4.4 Construction Dewatering

Construction dewatering is not expected during the installation of foundation. However, perched water and/or surface runoff condition could develop during the course of construction. Provisions should be made to provide sump pumping capability on-site during construction to control surface water runoff.

4.5 Underpinning

The scope of the preliminary investigation did not include assessment of underpinning requirement, which can be determined in the later investigation, if requested.

5. CONSTRUCTION MONITORING

5.1 Pre-construction Survey

It is strongly recommended that a pre-construction survey be conducted to document the existing conditions of the adjacent buildings, structures or sidewalks prior to commencement of any construction activities. The conditions of the adjacent structures/facilities/slabs should also be monitored periodically during the course of construction.

5.2 Protection of Adjacent Structures and Sidewalk

The excavation of the proposed cellar and footings may require underpinning and shoring of the existing adjacent footings, which, if determined to be required, shall be designed by a professional engineer engaged by the contractor. The contractor shall submit shop drawings to the project engineer for review and approval prior to installation. The installation shall be subject to special inspection by a qualified engineer in accordance with NYC Building Code.

5.3 Filling and Backfilling

Filling and backfilling should utilize qualified fill materials meeting the grading requirements for control fill as per NYC Building Code. Control fill should be placed in 12-inch loose lifts and each lift should be compacted to at least 95% of its maximum dry density as determined in accordance with ASTM D1557.

6. LIMITATION AND ADDITIONAL BORINGS

The conclusions and recommendations contained in this report are based on the subsurface data obtained during the preliminary investigation and on the details stated in this report. Should conditions be encountered which differ specifically from those stated in this report, we should be notified immediately so that our recommendations may be reviewed and/or revised, if necessary.

It is necessary to install additional borings after the existing buildings have been demolished in order to satisfy the NYC Building Code with respect to site investigation. The additional borings will serve to ascertain the initial boring findings and recommendations.

7. CONSTRUCTION CONSULTATION AND INSPECTION

Due to the nature of the soils and subsurface conditions at this site and the recommendations set forth herein, consultation and inspection services by a qualified soil engineer are recommended for the following:

1. Preparation of the site, including clearing, excavation of basement, and initial proofrolling and compaction of the in-situ soils.

2. Placement of all controlled backfill and/or fill, if any.

3. Pre-construction survey of adjacent structures.

4. Cellar excavation and footing subgrade inspection.

We trust the above information will allow you to proceed with the design and construction of the proposed mixed-use building.

We thank you for the opportunity of providing this service to you. Should you have any questions regarding this report, or if we can be of further assistance, please do not hesitate to contact us.

Respectfully Submitted
Geo Tech Consultants LLC

Steve J. J. Lin, P.E.

Test Borings Location Plan

LEGEND
- SPLIT SPOON SAMPLE
- DRILLING THROUGH
- CORE DRILLING
- SHELBY TUBE
- Penetration resistance per 6"
- BORING LOCATION
- BURNING WELL
- TEST PIT

NOTES:
1. SOILS WERE SAMPLED USING SPLIT-SPOON SAMPLER BY MEANS OF A 140 POUND HAMMER FREE FALLING A DISTANCE OF 30 INCHES, AUTOMATIC TRIP (OR CATHEAD), IN ACCORDANCE WITH ASTM D1586.
2. THE TOTAL NUMBER BLOWS FOR THE MIDDLE (2) INCHES OF PENETRATION IS DEFINED AS "STANDARD PENETRATION RESISTANCE (N)".
3. UNDISTURBED SOIL SAMPLES REPRESENTATIVELY OBTAINED BY MEANS OF SHELBY TUBE SAMPLING IN ACCORDANCE WITH ASTM D1587.
4. BEDROCK WAS CORED USING NX DIA BY DOUBLE TUBE BARRELS IN ACCORDANCE WITH ASTM D2113.
5. SOIL DESCRIPTIONS ARE MADE THROUGH VISUAL EXAMINATION OF SOIL SAMPLES IN ACCORDANCE WITH THE PROCEDURE ESTABLISHED IN NYC DOB.
6. SOIL CLASSIFICATIONS ARE PRIMARILY BASED ON THE UNIFIED SOIL CLASSIFICATION SYSTEM (USCS) AS WELL AS 2008 NYC BC SOIL CLASSIFICATION SYSTEM.
7. GROUND WATER TABLE WERE NOTED ON THE LOGS REPRESENTED THE LEVEL OF WATER WHERE IT WAS FIRST ENCOUNTERED DURING THE DRILLING.
8. BORING INSTALLED BY: URAEL TEST BORING CO. INC.

(b)(4)

RECD 03FEB15EP29 2:46

RECEIPT NUMBER RCW1527253131		CASE TYPE 1924 Application for Regional Center Under the Immigrant Investor Pilot Program
RECEIVED DATE September 29, 2015	APPLICATION TYPE: B (AMENDMENT)	REGIONAL CENTER NAME CENTURY NEW YORK CITY REGIONAL CENTER
NOTICE DATE September 29, 2015	PAGE 1 of 1	REGIONAL CENTER ID ID1420251818
SHAH MEHREEN MONA SHAH & ASSOCIATES RE: CENTURY NEW YORK CITY REGIONAL CENTER 299 BROADWAY STE 1005 NEW YORK NY 10007		NOTICE TYPE: Receipt Notice

Receipt Notice - This notice confirms that USCIS has accepted your "Application for Regional Center Under the Immigrant Investor Pilot Program" (Form I-924) for processing. This notice does not grant any immigration status or benefit. This notice does not grant any immigration status or benefit.

Processing Time – The current processing time for this type of case is estimated at 120 days. Unlike many other USCIS case types, verification or tracking of this case is not available on our website. We will notify you by mail when we make a decision on this case or if we need further evidence to establish your eligibility for the regional center designation.

Unique Identifier – In the top portion of this Notice, you will find a unique identifier that has been assigned to your Form I-924. Unlike a receipt number which changes with every filing, this unique identifier is *permanently* assigned to your approved or prospective regional center, and will be associated with any future request to amend the regional center. Please refer to your regional center's unique identifier as well as to the Form I-924 receipt number in all subsequent correspondence with USCIS regarding this application.

E-Mail Communication Regarding Your Pending Form I-924 Application – USCIS has established a direct e-mail communication tool to facilitate communication between USCIS and those applicants with pending Form I-924s. Form I-924 applicants may use the e-mail communication process to correspond with USCIS regarding pending Form I-924 applications, to include questions that may arise if USCIS issues a Request for Evidence (RFE) or a Notice of Intent to Deny (NOID). USCIS may also reach out to Form I-924 applicants via e-mail to informally ask for clarification on certain issues in order to facilitate USCIS' review, understanding, and adjudication of the Form I-924 application. USCIS may also e-mail a courtesy copy of the RFE or NOID to the e-mail address listed on the I-924 and, if applicable, to the e-mail address listed on the Form G-28 associated with the application.

Please use the following table to determine which email address has been assigned to your Form I-924.

If your unique identifier ends in the number:	Then please utilize this email address:
0, 1, or a 2	CSC-EB5-RCID0-2@dhs.gov
3, 4, or 5	CSC-EB5-RCID3-5@dhs.gov
6 or 7	CSC-EB5-RCID6-7@dhs.gov
8 or 9	CSC-EB5-RCID8-9@dhs.gov

Example: If a regional center's unique identifier is IDxxxxxxxxx0, then the regional center's Form I-924 has been assigned to email account CSC-EB5-RCID0-2@dhs.gov, as the unique identifier ends in "0".

E-Mail "Subject Line" Advisory - Please ensure that the subject line in your email correspondence contains the following information in this order: (1) Regional Center Unique Identifier; (2) Receipt Number; (3). Regional Center Name. Doing so will facilitate USCIS' timely handling of and response to your email correspondence.

E-mail Scope - This e-mail communication tool is to be used solely to facilitate communication between applicants with a pending Form I-924 and USCIS. The scope of the communication must relate to matters concerning the pending Form I-924. The direct e-mail communication initiative it is not a forum for general policy and legal questions about adjudicative procedures or decisions, or for questions relating to either "Immigrant Petition by Alien Entrepreneur" (Form I-526), "Petition by Entrepreneur to Remove Conditions" (Form I-829), or any "Appeal or Motion" (Form I-290B). USCIS will not respond to e-mails received concerning issues unrelated to the currently pending Form I-924. For more information about how to make other EB-5 inquiries, visit the EB-5 Inquiries page on the USCIS website (www.uscis.gov). USCIS will not respond to e-mails received concerning issues unrelated to the currently pending Form I-924 via this email communication process.

General Questions - USCIS has a page entitled EB-5 Inquiries at www.uscis.gov that outlines how the public may make other inquiries on EB-5 related matters, to include inquiries that you may have after the Form I-924 has been adjudicated. This page clarifies the EB-5 inquiries that are appropriate to send

Please see the additional information on the back. You will be notified separately about any other cases you filed.

U.S. CITIZENSHIP & IMMIGRATION SVC

to the general EB-5 mailbox (at uscis.immigrantinvestorprogram@dhs.gov), and other avenues that can be used to send questions or inquires to USCIS that are not suitable for the general EB-5 mailbox.

Attorney Or Accredited Representative - If a valid Form G-28 is associated with the Form I-924, USCIS will need to have a viable Form G-28 e-mail address for the legal representative in order to use the e-mail process to correspond with the Form I-924 applicant. If a valid Form G-28 is associated with the Form I-924 applicant, but USCIS does not have a viable Form G-28 e-mail address, then one will need to be obtained prior to USCIS sending any out-going e-mail correspondence to the applicant which discuss issues related to the Form I-924. In such circumstance, the legal representative should provide an updated Form G-28 with a valid e-mail address by sending a pdf of a fully executed Form G-28 to the EB-5 mailbox at uscis.immigrantinvestorprogram@dhs.gov.

Please see the additional information on the back. You will be notified separately about any other cases you filed.

Woodside, NY

Dear Ms. Chang:

Enclosed please find the Owner's Policy with regard to the above referenced matter.

If we can be of any further assistance please do not hesitate to call us.

Very truly yours,

Rose Ann Waters

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312 and I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed all appropriate inquires in conformance with the standards and practices set forth in 40 CFR Part 312.

The qualifications of the undersigned Environmental Professional and environmental staff contributing to this report are included in Appendix E.

Stephanie O. Davis

SECTION 1.0
INTRODUCTION

1.1 Purpose of the Phase I Environmental Site Assessment

The primary purpose of this Phase I Environmental Site Assessment (ESA) is to identify recognized environmental conditions at the subject property. Recognized environmental conditions (RECs) refers to the presence or likely presence of hazardous substances or petroleum products in, on, or at the property due to any release to the environment, under conditions indicative of a release to the environment, and/or under conditions that pose a material threat of a future release to the environment. De minimis conditions are not RECs.

Historic RECs (HRECS) include past releases of hazardous substances or petroleum products that occurred in connection with the property and have been addressed to the satisfaction of the applicable regulatory authority to meet established unrestricted use criteria without subjecting the property to any required controls. HRECs that do not meet the definition of RECs at the time this report was prepared are not listed in the Findings and Conclusions section of this report as RECs.

Controlled RECs (CRECs) include RECs resulting from a past release of petroleum products or hazardous substances that have been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. CRECs, if present, are listed in the Findings and Conclusions section of this report.

This Phase I ESA has been prepared for compliance with the American Society for Testing and Materials (ASTM) Standard Practice E 1527-13 for Phase I ESAs (2013). A Phase I ESA prepared following this Standard is intended to permit the User to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) liability by having performed all appropriate inquiry into previous ownership and uses of the property consistent with good commercial or customary practice. A Phase I ESA also assesses business environmental risk in association with the current or planned commercial use of the property. Additional objectives of the Phase I ESA include the identification of environmental conditions that are in noncompliance with applicable local, state, or federal laws or regulations and recognition of property conditions or practices that may lead to future environmental liability.

1.2 Scope of Services

FPM Group (FPM) was retained by Queens Blvd Venture, LLC (User) to perform a Phase I ESA for the property located at 64-02 & 64-06 Queens Boulevard, Woodside, New York (subject property), referenced by the following Queens Borough Tax Map Number: Block 2325, Lot 32. The scope of services includes those items detailed in the ASTM Standard Practice E 1527-13 and focused on the property history with regard to past land use and development, underground storage tanks (USTs), aboveground storage tanks (ASTs), chemical or hazardous substances spills, storage, use, or generation, and any other pertinent information that would indicate a potential source and/or pathway of contamination at the property. Included in this report, where applicable, is information obtained from interviews with knowledgeable individuals regarding the current and/or past usage of the subject property.

Significant assumptions, if any, are described in the applicable portions of the following sections of this report. Limitations and exceptions, if any, are described in Section 5.2 of this report. Special terms and conditions, if any, affecting the scope of services are described in the applicable portions of the following sections of this report.

1.3 Reliance

FPM understands that the User may rely on this report to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on CERCLA liability. The User may also rely on this report to assess business environmental risk in association with the current or planned commercial use of the property, to identify environmental conditions that are in noncompliance with applicable local, state, or federal laws or regulations, and/or to recognize property conditions or practices that may lead to future environmental liability. Reliance on this report by a different User than the User for which this report was prepared is subject to satisfying the User's Responsibilities in Section 6 of ASTM Standard Practice E 1527-13.

It should be noted that portions of this report were prepared using information provided by others. The environmental professional is not required to independently verify the provided information but may rely on this information unless he/she has actual knowledge that certain information is incorrect, or unless it is obvious that certain information is incorrect based on other information obtained in the Phase I ESA or otherwise actually known to the environmental professional.

SECTION 2.0
SUBJECT PROPERTY DESCRIPTION

2.1 Property Location and Legal Description

The subject property is identified as 64-02 & 64-06 Queens Boulevard, Woodside, New York, and is located on the southeast corner of the intersection of Queens Boulevard and 64th Street in the borough of Queens. The subject property is referenced by the following Queens Borough Tax Map number: Block 2325 and Lot 32. The subject property comprises approximately 12,000 square feet and is developed with an approximately 11,000-square-foot one-story commercial building and an associated paved parking area.

2.2 Property Environmental Setting

Groundwater in the vicinity of the property is derived from infiltration of precipitation through the ground surface and surficial deposits to the water table. The original surficial deposits likely consisted primarily of sand and gravel; however, the ground surface has been significantly modified due to previous development. Precipitation that may infiltrate the ground surface will enter the groundwater system. The water table is the upper limit of the groundwater reservoir and is bounded beneath by impervious bedrock which is located approximately 150 feet below mean sea level, or MSL (USGS, 1990).

The regional groundwater flow direction in the property area was obtained from the U.S. Geological Survey publication Water Table of the Upper Glacial Aquifer on Western Long Island, New York in March-April 2000. According to the map, the water table elevation is approximately 40 feet above MSL. Based on the map and the slope of the local topography, the regional groundwater flow direction is anticipated to be generally to the west.

The surface topography of the subject property and vicinity was obtained from the USGS Brooklyn, New York Quadrangle (1967, photorevised 1979). The topographic elevation of the subject property is approximately 50 feet above MSL. Based on these data, the depth to the regional groundwater beneath the subject property is estimated at approximately 10 feet.

No natural surface water bodies are located within one mile of the subject property.

2.3 Property Description and Usage

The subject property building is presently vacant, but was most recently occupied by an Auto Barn auto parts store.

2.4 Adjoining Property Usage

The subject property is surrounded by parcels utilized for residential and commercial purposes. A residential building with commercial retail space on the first floor adjoins the subject property to the west (across 64th Street). The Queens Motor Inn adjoins the subject property to the north (across Queens Boulevard). The FDNY Rescue Co. 4 and Engine Co. 292 adjoins the subject property to the east. Residential buildings adjoin the subject property to the south.

SECTION 3.0
RECORDS REVIEW

Records reviews were conducted during this portion of the study to evaluate the property history, potential environmental concerns on the property, and potential environmental concerns in proximity to the property. Records were obtained from several sources, within reasonable time and cost constraints (within 20 calendar days of our written request and at a nominal cost), as more fully described below.

3.1 Historical Information

➢ Historic Reference Documents

The objective of this portion of the study is to reconstruct the property history as it pertains to land use and development. For this purpose, information was sought from the following sources and is summarized below:

- Sanborn Fire Insurance maps
- Historic aerial photographs

Historic information concerning the property was also obtained from a property representative, User-provided documents, and other sources. This information is summarized in later sections of this report.

Sanborn Fire Insurance Maps of the subject property vicinity were provided by Environmental Data Resources (EDR) for the years 1902, 1914, 1932, 1951, 1981, 1982, 1986, 1988, 1989, 1991 through 1994, 1996, 1999, and 2001 through 2006. Copies of the maps are included in Appendix A. Information obtained from the fire insurance map review is as follows:

1902: The subject property and adjoining properties to the north and east are undeveloped and vacant. Railroad tracks adjoin the subject property to the west and south and appear to be present on the southwest corner of the subject property. A two-story dwelling and a one-story stable are developed on the adjoining property to the southeast at 44-12 65th Street.

1914: No significant changes are noted for the subject property or the adjoining property to the north. The railroad tracks are no longer depicted and it is noted that they will be abandoned. The FDNY building was developed on the adjoining property to the east in 1914. The stable has been removed from the adjoining property to the southeast and a small one-story building has been developed. The building on the adjoining property to the northwest is a market.

1932: A filling station consisting of a one-story garage, a one-story building, and three gas tanks has been developed on the western portion of the subject property. A two-story dwelling and one-story garage have been developed on the adjoining property to the south. The small one-story building has been removed from the adjoining property to the southeast. No significant changes are noted for the adjoining properties to the north and west.

1951: A one-story building labeled lumber has been developed on the subject property to the east of the filling station. The one-story building at the filling station is now a store. A one-story office building has been developed on the adjoining property to the west and the property is used for

used auto sales. A one-story garage has been developed on the adjoining property to the southeast. No significant changes are noted for the adjoining properties to the south, east, and north.

1981: The subject property has been redeveloped with the current commercial building constructed in 1960. A parking lot is present to the west of the building in the area where the filling station and gas tanks were formerly depicted. The adjoining property to the west has been redeveloped with a one-story commercial and warehouse building constructed in 1963. The adjoining property to the north was developed with a two-story building constructed in 1961; this building is occupied by the Queens Motor Inn Motel and contains 55 units. No significant changes are noted for the adjoining properties to the east, south, and southeast.

1982: No significant changes are noted for the subject property or the adjoining properties to the north, east, south, and southeast. The building on the adjoining property to the west is now all warehouse space and the commercial space has been removed.

1986-1991: No significant changes are noted for the subject property or the adjoining properties.

1992: No significant changes are noted for the subject property or the adjoining properties to the north, east, south, and southeast. The building on the adjoining property to the west is now occupied as commercial space.

1993-2005: No significant changes are noted for the subject property or the adjoining properties.

2006: No significant changes are noted for the subject property or the adjoining properties to the north, east, south, and southeast. The building on the adjoining property to the west has been removed.

A June 2010 aerial photograph of the subject property vicinity was obtained through the Google Earth website; a copy is included in Appendix A. The subject property and adjoining properties generally appear in their current configurations.

In summary, railroad tracks were present on the southwest corner of the subject property prior to 1914. Between 1914 and 1932 a filling station consisting of a one-story garage, a one-story building, and three gas tanks was developed on the western portion of the property. Between 1932 and 1951 a one-story lumber building was developed to the east of the filling station and the one-story building at the filling station was used as a store. The subject property was redeveloped with the current commercial building and parking lot in 1960; the parking lot occupies the area where the filling station and gas tanks were formerly depicted. The commercial buildings currently surrounding the subject property were developed between circa 1914 and 1963.

➢ Historic Agency Records

Historic records for the subject property were sought from several local agencies during this study. Factors such as chemical spills or storage, USTs, and other information that would indicate a potential source of contamination at or in the vicinity of the property were investigated using these records. Information requests were made by FPM during this Phase I ESA from the following sources:

- New York City Department of Finance, Queens County Office of the City Register
- City of New York, Department of City Planning website

- New York City Department of Buildings (DOB) website
- City of New York Fire Department (FDNY)
- Environmental Data Resources Inc. (EDR)
- Google Earth website
- New York City Department of Environmental Protection (NYCDEP)
- New York City Department of Health (NYCDOH)
- New York State Department of Environmental Conservation (NYSDEC)
- United States Environmental Protection Agency (USEPA)

Information pertaining to property ownership was obtained from the New York City Department of Finance, New York County Office of the City Register. A summary of the property ownership information is included in Table 3.1.1. The current owner of the subject property is Queens Blvd Ventures, LLC, which has owned the property since February 2015. Previously, the subject property was owned by various commercial entities. No industrial ownership is apparent.

TABLE 3.1.1
OWNERSHIP HISTORY
64-02 & 64-06 QUEENS BOULEVARD, WOODSIDE, NEW YORK
BLOCK 2325, LOT 32*

Owner	Date
Queens Blvd Ventures, LLC	2/23/2015 to Present
Romana Holding LLC	6/28/2004 to 2/23/2015
The Beer Boys, Inc.	8/31/1978 to 6/28/2004
Frederick Schroeter	4/8/1968 to 8/31/1978
Schroeter Lumber Corp.	4/8/1968 to 4/8/1968
Frederick Schroeter	Prior to 4/8/1968

Lot 32 was previously listed as Lots 26 and 30.
Source: New York County Office of the City Register

Information obtained from the City of New York, Department of City Planning website indicates that the subject property is zoned for residential and retail commercial use as R7X R4-1 with a C2-3 overlay. The property is presently e-designated as E-163 on the current zoning map (copy in Appendix A) for hazardous materials, air, and noise.

The New York City DOB website was accessed on March 17, 2015 to review complaints, violations, Certificates of Occupancy (COs), and permits regarding the subject property. CO #136513 was issued on September 1, 1960 for new building permit #1996-59. CO #204583 was issued on September 26, 1986 for alteration permit #1180-84. The first floor of the building contained space for

retail sales, offices, accessory storage, and loading and unloading. A mezzanine contained office and storage space. There was also an accessory parking lot for 12 cars. Two resolved complaints were filed in 1989 for illegal signs. A violation was issued in 1986 and was dismissed on November 14, 1986. New building permits were issued in 1917, 1921, 1933, 1937, and 1959. Alteration permits (unspecified alterations) were issued in 1970 and 1984. Copies of the information obtained during review of the online DOB records are included in Appendix A.

The FDNY was contacted on March 3, 2015 and information pertaining to fuel oil tanks, tank removals, tank leaks and violations was requested. Responses were received on March 19 and 23, 2015 indicating that the FDNY does not maintain any such files. Copies of the FDNY request and response are included in Appendix A.

The NYCDEP was contacted on March 3, 2015 and information regarding the use, storage and disposal of hazardous waste, USTs, ASTs, environmental inspections, reviews, violations and remediation was requested. A response was received on March 17, 2015 indicating that the NYCDEP does not maintain any such files. Copies of the NYCDEP request and response are included in Appendix A.

The NYCDOH was contacted on March 3, 2015 and information regarding chemical or hazardous material storage and/or disposal, USTs, ASTs, sampling, inspections, violations, remediation and industrial files was requested. A response was received on March 16, 2015 acknowledging the request. If any files are made available, they will be reviewed and any pertinent information will be forwarded. Copies of the NYCDOH request and response are included in Appendix A.

The NYSDEC was contacted on March 3, 2015 and information regarding hazardous waste substance regulation, sampling, remediation, violations, waste disposal, discharge monitoring, non-compliance, inspections, monitoring, environmental permits and engineering was requested. A response was received on March 17, 2015 indicating that the NYSDEC does not maintain any such files. Copies of the NYSDEC request and response are included in Appendix A.

The USEPA Region II database was accessed on March 3, 2015 (www.epa.gov/region02/) and the subject property did not appear on the Resource Conservation and Recovery Act (RCRA) or on the Comprehensive Environmental Resource Conservation and Liability Information System (CERCLIS) databases, or as a No Further Remedial Action Planned (NFRAP) site.

3.2 Federal and State Environmental Records Sources

Standard federal and state databases were accessed by EDR to identify areas of potential concern in the vicinity of the subject property. The search distances were chosen in accordance with the ASTM Standard for Phase I ESAs (ASTM, E 1527-13, Section 8.2.1) as summarized in Table 3.2.1. Table 3.2.1 also includes the federal and state database information summary, the proximity of the properties of environmental concern to the subject property, and the hydrologic position of the properties of environmental concern with respect to the subject property. It should be noted that the locations of the properties of environmental concern were evaluated with respect to the regional groundwater flow direction (west). Properties of environmental concern located downgradient and at a distance from the subject property were presumed not to present a concern because of their hydraulic location. Pertinent portions of the state and federal database search results are included in Appendix B.

TABLE 3.2.1

Source: EDR

The subject property was identified as an e-designated site. The designation is E-163 for hazardous materials, air, and noise. No further information is provided and the property was not listed on any of the other environmental databases. The e-designation is likely related to the former filling station at the subject property.

The NYC Fire Department Engine Company 292, adjoining the subject property to the east (upgradient) at 64-18 Queens Boulevard, was identified on the RCRA No Longer Registered (NLR), NYSDEC Spills, and Petroleum Bulk Storage (PBS) databases. The facility was last listed as a large-quantity generator of ignitable waste, lead, benzene, and chlordane in August 1994. No RCRA violations or enforcement actions were noted. NYSDEC spill number 92-05404 was assigned on August 11, 1992. This spill is related to spill number 94-04336 which was assigned on June 28, 1994. The spill reports do not identify why the spill numbers were issued, but apparently a spill of 100 gallons of petroleum occurred. It is noted that the spills should be closed because the NYC Department of General Services (DGS) removed the drums containing the petroleum contaminants. The two spills were closed on August 11, 1992 and October 3, 1997, respectively. Spill number 12-03463 was assigned on July 10, 2012 following the release of approximately 15 gallons of #2 fuel oil due to an overfill during a delivery. The spill was contained and cleaned up, no drains or soil was affected, and the spill was closed on July 12, 2012. The facility was identified on the PBS database for a 2,500-gallon #2 fuel oil AST installed in December 1980 and removed in March 2001 and an in-service 550-gallon diesel AST installed in February 1998. A request was submitted to the NYSDEC on March 31, 2015 for any files related to these three closed spills. A response had not yet been received at the time this report was prepared. If any files are made available, they will be reviewed and any pertinent information will be forwarded. A copy of the NYSDEC request is included in Appendix A. Based on the available information, which indicates that the spills are closed and no subsurface remediation was apparently required, this site does not pose an environmental concern for the subject property.

The intersection of Queens Boulevard and 64th Street, adjoining the subject property to the northwest (downgradient), was identified on the RCRA NLR and NYSDEC Spills databases. Con Edison Manhole #1263 was identified on the RCRA NLR database due to miscellaneous polychlorinated biphenyl (PCB) wastes and petroleum oil with less than 500 parts per million (ppm) PCBs generated onsite. No RCRA violations or enforcement actions were noted. Spill number 02-11002 was assigned to Vault #6100 on February 2, 2003 following the release of approximately 170 gallons of dielectric fluid from a leaking transformer. Impacted soil was removed from the vault and the vault was cleaned. No sewers were reportedly affected. The spill was closed on April 3, 2003. A request was submitted to the NYSDEC on March 31, 2015 for any files related to this closed spill. A response had not yet been received at the time this report was prepared. If any files are made available, they will be reviewed and any pertinent information will be forwarded. A copy of the NYSDEC request is included in Appendix A. Based on the available information, this site does not pose an environmental concern for the subject property.

Two facilities were identified on the Solid Waste Landfill database within the ASTM search radius. SDR Process Corp., located approximately 0.44 miles southeast (up/crossgradient) of the subject property at 50-15 69th Place, was identified as an inactive transfer station. Con Edison, located approximately 0.48 miles southeast (up/crossgradient) of the subject property at 50-40 70th Street, was identified as an inactive transfer station. No further information was provided for either facility. Based on the available information, these sites do not pose an environmental concern for the subject property.

An Amoco Service Station, located approximately 0.06 miles east (upgradient) of the subject property at 65-10 Queens Boulevard, was identified on the Leaking Underground Storage Tank (LUST) and NYSDEC Spills databases. Spill number 11-03843 was assigned on July 7, 2011 following a tank test

failure on a waste/used oil tank. No further information was provided and this spill remains active. Spill number 89-03239 was assigned on June 28, 1989 following the discovery of gasoline contamination during the removal of 14 550-gallon tanks. Approximately 140 cubic yards of impacted soil were removed and monitoring wells were installed. Free-phase product is present in several of the monitoring wells and the groundwater is impacted with benzene, toluene, ethylbenzene, and xylenes (BTEX). During groundwater monitoring it was determined that the site-specific groundwater flows to the south-southwest, which places this site hydraulically crossgradient from the subject property. Remediation is ongoing and the spill remains active. Spill number 05-10718 was assigned on December 13, 2005 following a line test failure on a gasoline fuel line. The line was repaired and passed a retest. The spill was closed on December 19, 2005. Based on the available information, which indicates that this site is not upgradient of the subject property, this site does not pose an environmental concern for the subject property.

There were no other sites identified within the ASTM-designated search radii that appear to present an environmental concern for the subject property.

3.3 Previous Investigations

A Phase II ESA was prepared for the subject property in May 2004 by EEA, Inc. (EEA). A copy of this report was provided by the User and is included in Appendix D. It was noted that a previous Phase I ESA prepared for the subject property (not provided) identified a permit noting 10 gasoline tanks and 4 gasoline pumps formerly present at the property. The 1932 and 1951 Sanborn Fire Insurance Maps also showed three gasoline tanks on the northwest portion of the property, which was labeled as a filling station. EEA performed a magnetometer survey of the property and conducted six soil borings in the northwest portion of the subject property where the USTs had been located. The magnetometer survey did not identify any former USTs, which suggests that the USTs may have been removed during redevelopment of the property. Five samples were collected from the six soil borings at a depth of 12 feet below grade (estimated to be below the bottom of the former USTs) and were analyzed for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), and total petroleum hydrocarbons (TPH). All of the detections were below the 6NYCRR Part 375 Soil Cleanup Objectives (SCOs) for unrestricted use. It was concluded that the former use of the property as a filling station had not resulted in subsurface impacts. There were no recommendations for further investigation.

A Phase II Subsurface Investigation was prepared for the subject property in September 2014 by Advanced Cleanup Technologies, Inc. (ACT). A copy of this report was provided by the User and is included in Appendix D. ACT performed a geophysical survey, conducted three soil borings, and collected two soil vapor samples from the parking lot. The geophysical survey did not identify any anomalies suggestive of USTs. Six soil samples were collected from the three soil borings located in the areas showing the greatest potential for contamination. The soil samples were analyzed for VOCs, SVOCs, Target Analyte List (TAL) metals, polychlorinated biphenyls (PCBs), and pesticides. Acetone was the only VOC detected above its unrestricted use SCO in two soil samples, but the detections were below the restricted residential use SCO. Acetone was noted to be a common laboratory contaminant. The metals cadmium, copper, lead, nickel, and/or zinc were detected above unrestricted use SCOs in two of the soil samples. All of these metals detections were below the restricted residential use SCOs. The metals detections were attributed to the presence of historic fill. No SVOCs, PCBs, or pesticides were detected in the soil samples above the unrestricted use SCOs. The two soil vapor samples were analyzed for VOCs and three of the VOCs, tetrachloroethene (PCE), trichloroethene (TCE), and methylene chloride, were detected at levels above the indoor air Air Guideline Values in the October 2006 New York State Department of Health (NYSDOH) "Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York". The PCE and TCE detections were found at levels for which the NYSDOH would require no further action, monitoring, or mitigation (depending on the associated indoor air concentrations of PCE and TCE).

3.4 User-Provided Information

The Phase II ESA reports discussed above were provided by the User. FPM provided the User with a User Questionnaire to assist FPM in obtaining information about the subject property relevant to identifying RECs. Specialized knowledge or experience of the User with respect to the property and commonly known or reasonably ascertainable information about the property within the local community were specifically requested. A copy of the completed questionnaire is included in Appendix D. The User noted that the purchase price is the same as the appraised value of the property.

The User was requested to provide a copy of recorded land title records and judicial records concerning the property from which information could be obtained concerning environmental liens or activity and use limitations (AULs) that may be present. The User was also asked to provide any actual knowledge of environmental liens or AULs that may encumber the property. The User did not report any liens or AULs for the property.

FPM understands that this Phase I ESA is being performed by the User to qualify for landowner liability protection for CERCLA liability and to assess business risk.

SECTION 4.0
PROPERTY RECONNAISSANCE

FPM personnel inspected the subject property on March 16, 2015. All areas of the property were accessible at the time of the inspection. A property representative accompanied FPM during the reconnaissance and was interviewed to obtain information regarding uses and physical characteristics of the property. Information obtained during the interview is included in the appropriate sections below. A photolog documenting current property conditions is included in Appendix C.

The subject property comprises approximately 12,000 square feet and is developed with an approximately 11,000-square-foot one-story commercial building and an associated paved parking area. A site plan depicting the current property features is shown in Figure 4.1.

Occupant/Operation:

The subject property building is presently vacant.

Prior Occupants/Use:

The current commercial building at the subject property was developed in 1960 and has been occupied by various stores, including most recently an Auto Barn auto parts store. A filling station with gasoline tanks was developed on the western portion of the subject property between 1914 and 1932 and remained until sometime between 1951 and 1960. A lumber building was developed to the east of the filling station between 1931 and 1951 and remained until sometime between 1951 and 1960. Railroad tracks were present on the southwest portion of the property prior to 1914.

Hazardous Substance/Petroleum Products Inventory:

No hazardous substances or petroleum products were observed at the subject property at the time of the inspection.

ASTs/USTs Inventory:

No visible evidence of any ASTs or USTs (fill pipes, vent pipes, supply lines) was noted during the site inspection.

Sanitary Waste Management

The subject property is connected to the municipal sewer system. No evidence of any current or former onsite sanitary waste disposal systems was noted during the site inspection.

Solid Waste Disposal:

Solid waste is containerized for offsite disposal. Solid waste consisting of old shelving and other materials associated with the former retail use of the subject property was noted throughout the building. No significant staining, leakage, or other evidence of inappropriate disposal was noted in association with the waste.

FIGURE 4.1
SITE PLAN
64-02 & 64-06 QUEENS BOULEVARD
WOODSIDE, NEW YORK
Drawn By:H.C.
Checked By:G.H.
Date:3/11/15

Drums/Unidentified Substance Containers:

An empty 55-gallon drum was noted in the building. No evidence of staining or leakage was noted in association with the drum.

Wells:

No wells were noted on the subject property at the time of the inspection. The subject property is connected to the municipal water supply.

Heating, Ventilation and Cooling:

The subject property is heated with roof-mounted natural gas-fired units. No potential oil-fired heating systems were observed.

PCB Electrical Components:

No potential PCB-containing electrical components were noted on the subject property at the time of the inspection.

Staining and Corrosion:

No significant staining or corrosion was observed during the site inspection.

Floor Drains and Sumps:

No floor drains or sumps were observed at the subject property at the time of the inspection.

Stormwater Drainpools/Subsurface Drainage Structures:

No stormwater drainpools or subsurface drainage structures were observed at the subject property at the time of the inspection.

Stressed Vegetation:

No stressed vegetation was observed at the subject property at the time of inspection. .

Dumping:

No evidence of dumping was observed on the subject property at the time of inspection.

Disturbed Soil Mounding/Excavation:

No evidence of disturbed soil or excavation was observed at the subject property at the time of the inspection.

Radon:

Due to the depth to bedrock in the property area, radon does not appear to be a concern at the subject property. Based on the 1993 U.S. Geological Survey Open-file Report 93-292-B entitled "Geologic Radon Potential of EPA Region 2", the average indoor radon concentration in Queens County is 1.4

picocuries per liter and is among the lowest concentrations in New York State. The USEPA recommends that action be taken to reduce radon concentrations if they exceed four picocuries per liter. Radon does not appear to be a concern at the subject property.

Radiation:

There was no indication that past or present property activities may have included the generation or storage of radiation sources at the subject property.

Adjoining Property Descriptions:

The subject property is surrounded by parcels utilized for residential and commercial purposes. A residential building with commercial retail space on the first floor adjoins the subject property to the west (across 64th Street). The Queens Motor Inn adjoins the subject property to the north (across Queens Boulevard). The FDNY Rescue Co. 4 and Engine Co. 292 adjoins the subject property to the east. Residential buildings adjoin the subject property to the south. Based on FPM's observations of the adjoining properties from the vantage point of the subject property and adjacent public roads, no visible environmental concerns were noted.

SECTION 5.0
FINDINGS AND CONCLUSIONS

5.1 Findings and Opinions

FPM has performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-13 for the property located at 64-02 & 64-06 Queens Boulevard, Woodside, New York. Any exceptions to, or deletions from, this practice are described in Section 5.2 of this report.

This assessment was used to identify the potential presence of Recognized Environmental Conditions (RECs), historic RECs (HRECs), controlled RECs (CRECs), and de minimis conditions in connection with the property. Any RECs, HRECs, CRECs, and/or de minimis conditions identified for the property are described below.

- The subject property occupies approximately 12,000 square feet on the southeast corner of the intersection of Queens Boulevard and 64th Street in the borough of Queens and is referenced by the following Queens Borough Tax Map number: Queens, Block 2325 and Lot 32. The subject property is developed with an 11,000-square-foot one-story commercial building and an associated paved parking area. The property is currently owned by Queens Blvd Ventures, LLC, which has owned the property since February 2015. The property was previously owned by various commercial entities. No industrial ownership is apparent. The subject property is zoned for residential and retail commercial use as R7X R4-1 with a C2-3 overlay. The property is presently e-designated as E-163 on the current zoning map for hazardous materials, air, and noise.

- The subject property was originally developed with railroad tracks on the southwest corner of the property prior to 1914. Between 1914 and 1932 a filling station consisting of a one-story garage, a one-story store building, and three gas tanks was developed on the western portion of the property, with the tanks located beneath the northwestern portion of the property. Between 1932 and 1951 a one-story lumber building was developed to the east of the filling station. The subject property was redeveloped with the current commercial building and parking lot in 1960. The subject property building is currently vacant and was most recently occupied as an Auto Barn auto parts store. The E-163 designation for hazardous materials likely resulted from the former filling station use.

- A Phase II ESA was conducted by others at the subject property in May 2004 to assess the former filling station area. A previous Phase I ESA of the subject property identified a permit noting 10 gasoline tanks and 4 gasoline pumps formerly present at the property, consistent with the Sanborn Fire Insurance Map information. A magnetometer survey was performed for the filling station area and no USTs were identified. Six soil borings were performed in the area where in the USTs were formerly present, with five samples collected from 12 feet below grade and analyzed for VOCs, SVOCs, and TPH. All of the detections were below the 6NYCRR Part 375 SCOs for unrestricted use. It was concluded that the former filling station and associated USTs had not impacted the property subsurface. No recommendations were made for further investigation and no remedial activities were indicated. The former filling station and associated gasoline tanks appear to be an HREC based on the results of this investigation.

- A Phase II Subsurface Investigation was conducted by others at the subject property in September 2014 to further assess the former filling station area. A geophysical survey of the parking lot did not identify any anomalies suggestive of USTs. Three soil borings were conducted

in the parking lot and six soil samples were collected analyzed for VOCs, SVOCs, TAL metals, PCBs, and pesticides. Acetone, a common lab contaminant, was the only VOC detected above its unrestricted use SCO in two soil samples, but the detections were below the restricted residential use SCO. Cadmium, copper, lead, nickel, and/or zinc were detected above unrestricted use SCOs in two of the soil samples; all of these metals detections were below the restricted residential use SCOs and were attributed to the presence of historic fill. No SVOCs, PCBs, or pesticides were detected in the soil samples above the unrestricted use SCOs. Two soil vapor samples were collected from the parking lot and analyzed for VOCs. PCE, TCE, and methylene chloride were detected at levels above the NYSDOH Air Guideline Values for indoor air; the PCE and TCE detections were at levels for which the NYSDOH would require no further action, monitoring, or mitigation, depending on the associated indoor air concentrations of PCE and TCE. The elevated levels of PCE, TCE, and methylene chloride in the soil vapor are a REC. The former filling station and associated gasoline tanks appear to be an HREC based on the results of this investigation and the 2004 investigation.

- Groundwater is present at a depth of approximately 10 feet below grade beneath the subject property and generally flows to the west.

- An empty 55-gallon drum was noted in the building. No evidence of staining or leakage was noted in association with the drum.

- Solid waste is containerized for offsite disposal. Solid waste consisting of old shelving and other materials associated with the former retail use of the subject property was noted throughout the building. No significant staining, leakage, or other evidence of inappropriate disposal was noted in association with the waste.

- The subject property is heated with roof-mounted natural gas-fired units. No potential oil-fired heating systems were observed or reported for the property.

- The subject property is connected to the municipal water supply. No wells were observed at the subject property.

- No indications of current or former onsite sanitary waste disposal systems were noted at the property. The subject property is connected to the municipal sewer system.

- No ASTs/USTs, hazardous substances, petroleum products, unidentified containers, PCB electrical components, staining, corrosion, floor drains, sumps, stormwater drainpools, subsurface drainage structures, stressed vegetation, disturbed soil mounding, excavations, or evidence of potential radiation were observed at the subject property during the inspection. Radon is not expected to present a concern.

- The subject property is adjoined by properties utilized for residential and commercial purposes. No visible environmental concerns were noted.

- The potential for hazardous substances or petroleum products to migrate at the property in any form (solid and liquid at the surface and in the subsurface, and vapor in the subsurface) was evaluated. Based on the available information, which indicates that PCE, TCE, and methylene chloride are present in the soil vapor below the parking lot, it is possible that hazardous substances and/or petroleum products are present in the subsurface of the subject property. Although the previous Phase II investigations did not identify any contamination associated with the former gasoline tanks in the area where it was most likely to be present, there is the potential

for soil vapor intrusion for buildings at the subject property. It does not appear that hazardous substances and/or petroleum products have the potential to migrate onto the property from nearby environmental sites.

5.2 Deviations and Data Gaps

The only identified deviations and/or data gaps that may affect our ability to identify RECs, HRECS, and/or CRECS are as follows:

- Records regarding the subject property were requested from the NYCDOH. A final response has not yet been received from this agency. Although the NYCDOH may maintain pertinent information, much of the anticipated information has been provided from other sources. Therefore, this data gap is not considered significant.

5.3 Conclusions and Recommendations

Based on the findings and opinions, and considering the deviations, limitations, and data gaps, we conclude that the following RECs, HRECS, and CRECS have been identified for the property:

- The presence of PCE, TCE, and methylene chloride in the soil vapor below the parking lot area is considered a REC.

- The former filling station and associated gasoline tanks is considered an HREC.

Based on the identified RECs, HRECS, and CRECs, we have developed the following recommendations:

- The PCE, TCE, and methylene chloride levels detected in soil vapor beneath the parking lot are not suggestive of a significant source. However, any new construction at the subject property should be equipped with a vapor barrier and sub-slab piping, in the event that mitigation is needed for soil vapor intrusion.

- As the property is e-designated for hazardous materials, a Phase II investigation will be necessary. It is recommended that a Phase II Investigation Work Plan be developed in accordance with the requirements of the NYC Office of Environmental Remediation and that the Phase II Work Plan be submitted to the NYC Office of Environmental Remediation, together with this Phase I ESA Report, for review and approval

SECTION 6.0
DISCLAIMER

Observations and conclusions in this report are limited to those areas addressed in the study and represent our best judgment using the practices set forth in the ASTM Standard with which this report complies, as well as our past experience. Our investigation has been scientific and thorough; however, it is possible that certain areas of this property may pose environmental concerns that are, as yet, undiscovered. The following considerations apply to this report:

- A Phase I ESA is a non-invasive evaluation. No sample collection or subsurface analysis was conducted at the subject property as part of this Phase I ESA unless expressly detailed in this report.

- This Phase I ESA is based on the version of the ASTM Standard for Phase I ESAs (E 1527) under which it was prepared, as specified in Section 1 of this report, and other current environmental regulations as detailed herein. Future changes in environmental regulations and/or regulatory agency guidance may affect the interpretations and conclusions in this report.

- Asbestos-containing building materials, lead-based paint, mold, and indoor air quality are considered non-scope issues under the ASTM Standard for Phase I ESAs. This report does not address these potential environmental issues except as expressly described herein.

- Information acquired and evaluated during this Phase I ESA was provided by others. In accordance with the ASTM Standard, FPM is not required to independently verify the accuracy of provided information but may rely on this information unless we have additional information that indicates that the provided information is incorrect.

- This Phase I ESA report is dated, and the findings contained herein are based on the visible conditions existing at the subject property on the date of the inspection and as indicated in the provided information. Alterations of the subject property that may occur subsequent to the date of this report are not addressed herein.

- This Phase I ESA report is subject to the Terms and Conditions of the contract under which it was prepared.

DEPARTMENT OF BUILDINGS

BOROUGH OF QUEENS, THE CITY OF NEW YORK

No. 4 176513

Date 9/28/

CERTIFICATE OF OCCUPANCY

(Standard form adopted by the Board of Standards and Appeals and issued pursuant to Section 646 of the New York Charter, and Sections C26-1102 to C26-1107 inclusive, Administrative Code 2141.1 to 2141.7, Building Code.)

This certificate supersedes C. O. No.

To the owner or owners of the building or premises:

THIS CERTIFIES that the new [illegible] building—premises located at

[illegible] Block 8325 Lot 32 W 35

conforms substantially to the approved plans and specifications, and to the requirements of the building code and all other laws and ord[illegible]ances, and of the rules and regulations of the Board of Standards and Appeals, applicable to a building of its class and kind at the time the permit was issued; and

CERTIFIES FURTHER that the provisions of Section 2405 of the New York Charter have been complied with as certified by a report of the Fire Commissioner to the Borough Superintendent.

N.B. and Alt. No. [illegible] Construction classification— Fireproof

Occupancy classification— Comm. Height 1 Stories 1 Feet 25

Date of completion— 8/28/28 Located in [illegible] Fire District

B & C Area 1 1/2 Height Zone at time of issuance of permit

This certificate is issued subject to the conditions and restrictions specified and in the following form filed by the Board of Standards and Appeals: [illegible]

PERMISSIBLE USE AND OCCUPANCY

STORY	LIVE LOADS Lbs. per Sq. Ft.	PERSONS ACCOMMODATED MALE	FEMALE	TOTAL	USE
1	[illegible]	5	5	[illegible]	[illegible]

[illegible]

CERTIFICATE WILL BE NULL AND VOID IF ALTERED IN ANY MANNER OR ACCOMPANIED BY ANY ALTERATION OF PLANS.

(Page 1)

CERTIFICATE OF OCCUPANCY

NO CHANGE OF THE OCCUPANCY INCONSISTENT WITH THIS CERTIFICATE SHALL

Unless an appeal for the same has been obtained from the Borough Superintendent, no change or enlargement in the structural parts of the building, or altering the light and ventilation of any part thereof, or its exit facilities, shall be made; no enlargement, whether by extending on any side or by increasing in height shall be made; nor shall the building [illegible] public or another; nor shall there be any reduction or diminution of the area of the lot or plot upon which the building is located.

The building or any part thereof shall not be used for any purpose other than that for which it is certified.

The occupancy, maximum, theoretical floor, or estimated loads producing the same stresses in the construction, in any story shall not exceed the loads specified on reverse side; the number of persons of either sex in any story shall not exceed that specified when sex is indicated, nor shall the aggregate number of persons occupying places of the above [illegible] the use to which any story may be put shall be restricted to that fixed by the certificate except as specifically stated.

This certificate does not relieve the owner or owners or any other person or persons in possession or control of the building, or any part thereof, from obtaining such other permits, licenses or approvals as may be required by law for the use or occupancy for which the building is designed or intended; nor from obtaining all permits, licenses or approvals required by law for the [illegible] of any equipment; nor from the installation of fire alarm signal devices required by law; nor from complying with any lawful order for additional fire extinguishing appliances issued by the Commissioner of the Fire Department; nor from complying with any lawful order issued with the object of maintaining the building in a safe or lawful condition; nor from complying with any [illegible] in public highways or other public places, whether attached to or part of the building or not.

If this certificate is marked "temporary", it is applicable only to those parts of the building indicated [illegible] and applies for the limited use and occupancy of only such parts of the building; it is subject to all the [illegible] and conditions specified in the first or permanent certificate; it is not applicable to any building under the [illegible] of the Fire Department unless it is also approved and endorsed by them, and it must be replaced by a [illegible].

If this certificate is for an existing building erected prior to March 14, 1916, it has been duly inspected and it has been found to have been occupied or arranged to be occupied prior to March 14, 1916, as noted on the reverse side, and that on information and belief, since that date there has been no alteration or conversion as a result of which the classification or subject to the Building Code, or that would necessitate compliance with some special requirement of [illegible] the Multiple Dwelling Law or any other law or ordinance; that there are no notices of violations or orders pending in the Department of Buildings at this time; that Section 646F of the New York City Charter has been complied with as certified by a report of the Fire Commissioner to the Borough Superintendent, and that, so long as the building is not altered, except by permission of the Borough Superintendent, the existing use and occupancy may be continued.

"§646F. No certificate of occupancy shall be issued for any building, structure, enclosure, place or premises wherein provisions for sprinklers, standpipes, explosives, inflammables and other dangerous substances, articles, compounds or substances are stored, or wherein automatic or other fire alarm systems or fire extinguishing equipment are required by law to be or are installed, until the fire commissioner has tested and inspected and has certified his approval in writing of the installation of such containers, systems or equipment to the Borough Superintendent of the borough in which the installation has been made. Such approval shall be recorded on the certificate of occupancy."

Additional copies of this certificate may be obtained at a nominal charge by the owner of the building or premises upon payment of a fee of fifty cents per copy.

Dear Mr. Holmes:

In response to your Freedom of Information Law information request of 3/3/2015, the Division of Air/Noise Enforcement and Policy has searched its files for records pertaining to 64-02 Queens Boulevard and:

☐ Has located and enclosed the requested documents.

☐ A total of _____ pages of materials have been located, for which we are required to charge a fee of $.25 per page. Please send your check, in the amount of $_____, to:

Records Access Officer
NYC Department of Environmental Protection
59-17 Junction Boulevard, 19th Floor
Flushing, NY 11373

The check should be made payable to **The City of New York** and include the Log # noted below.

☐ Upon receipt of the check, copies of these records will be sent to you.

☒ Does not have the requested documents.

Sincerely,

Geraldine Kelpin
Director, Air/Noise Enforcement & Policy

Re: **Phase I Environmental Site Assessment for a Property located in Queens, New York**
FPM File No. 1121g-15-08/01

Dear Ms. Bryant:

In accordance with the Freedom of Information Act (FOIA), this is a written request to review all files at the NYCDOH for the following property located in **Queens**:

- 64-02 and 64-06 Queens Boulevard, Woodside 11377 (Block 2325, Lot 32)

Specifically, I am requesting files pertaining to hazardous/toxic/chemical waste storage and disposal, violations, spills, under/above ground storage tanks, remediation, sampling, sanitation, or any other environmental concerns at this property.

Please confirm no other divisions maintain files for these properties and contact me as soon as this information becomes available for my review. Thank you for your prompt attention to this request.

Sincerely,

George Holmes
Hydrogeologist

Dear Ms. /Mr.:

NYSDEC/Region 2 has reviewed your request for the above referenced records under New York State's Freedom of Information Law (FOIL). Please note that most of our records are filed by number under the names of individuals or corporations. We have no way of locating or retrieving records if they are filed under names or addresses other than those you have provided.

If no records have been located, this does not necessarily mean, and should not be interpreted to mean that there have never been any violations, complaints, claims, investigations or inquiries involving those names or addresses. We cannot make any representations as to whether there are or have been any such violations, complaints, Claims, investigations or inquiries.

☒ after a diligent search of Region 2 available files, no records could be located for the names and/or addresses you provided.

Please email your future FOILs to Region directly to the following email address: r2foil.foil@dec.ny.gov

Thank you for your request. If additional information is needed, please call Gloria Silva/FOIL Secretary at (718) 482-4507, or email me at: r2foil.foil@dec.ny.gov

Sincerely yours,
Fawzy I. Abdelsadek, Ph.D., P.E.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 12/09/2014 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
X *SAFETY-KLEEN SYSTEMS INC WOODS*	*58-05 SAND AVENUE*	*SW 1/2 - 1 (0.528 mi.)*	*133*	*472*

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/09/2014 has revealed that there is 1 RCRA-SQG site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
X BP PRODUCTS NORTH AMERICA INC	60-11 QUEENS BLVD SUITE	WNW 1/8 - 1/4 (0.173 mi.)	P70	318

State- and tribal - equivalent CERCLIS

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 02/16/2015 has revealed that there are 2 NY SHWS sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

Class Code: Significant threat to the public health or environment - action required.

EXECUTIVE SUMMARY

State and tribal landfill and/or solid waste disposal site lists

NY SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the list.

A review of the NY SWF/LF list, as provided by EDR, and dated 01/06/2015 has revealed that there are 2 NY SWF/LF sites within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
ulcg – SDR PROCESS CORP.	50-15 69TH PLACE	SE 1/4 - 1/2 (0.440 mi.)	128	466
ulcg – ***CON EDISON***	***50-40 70 ST***	***SE 1/4 - 1/2 (0.481 mi.)***	***132***	***470***

State and tribal leaking storage tank lists

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 02/16/2015 has revealed that there are 31 NY LTANKS sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

State and tribal registered storage tank lists

NY TANKS: This database contains records of facilities that are or have been regulated under Bulk Storage Program. Tank information for these facilities may not be releasable by the state agency.

A review of the NY TANKS list, as provided by EDR, and dated 12/29/2014 has revealed that there is 1 NY TANKS site within approximately 0.25 miles of the target property.

Records of Emergency Release Reports

NY Spills: Data collected on spills reported to NYSDEC. is required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, and dated 02/16/2015 has revealed that there are

EXECUTIVE SUMMARY

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/09/2014 has revealed that there are 9 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR US Hist Auto Stat: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Auto Stat list, as provided by EDR, has revealed that there are 8 EDR US Hist Auto Stat sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR US Hist Cleaners: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Cleaners list, as provided by EDR, has revealed that there are 3 EDR US Hist Cleaners sites within approximately 0.25 miles of the target property.

Hazardous Waste Summary:
Waste code: D000
Waste name: Not Defined

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D008
Waste name: LEAD

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "O'CONNELL"e2mls no. 147-010:02-FEB-2003 20:03 HRS FOUND 1 PINT UNKNOWN OIL ON 1 PINT WATER MIXED WITH LEAVES AND DIRT IN TM6100. NO SEWERS OR WATERWAYS APPEAR TO BE AFFECTED. TOOK SAMPLE - CLEAN UP PENDING RESULTS. WILL HAVE UNIT PRESSURE TESTED. PCB HISTORICAL IS 34 PPMDATED 6/11/96. UPDATE:03-FEB 2003 0100HRS LAB RESULTS RETURNED LSN# 03-00933-001 25 PPM.UPDATE 2/3/03 11:50 HRS. CALLED QUEENS EQUIP. GROUP TO REQUEST PRESSURE TEST FOR THIS TRANSFORMER DUE TO UNKNOWN OIL. SPOKE WITH SUPERVISOR CHRIS HOFFMAN WHO INFORMED ME HE HAD CREW ON LOCATION DRAINING THE UNIT.UPDATE 2-3-03 1200 HRS NETWORK REPORTS HE WAS SENT TO LOCATION TO PRESSURE TEST UNIT. TRANSF IS ON FDR 1Q19 AND WAS DROPPED OFF SYSTEM. HE FOUND UNIT BELOW MIN. HE DID NOT PRESSURE TEST UNIT. AND UNDER 50 PPM TANKER WAS ON LOCATION AND DRAINED TRANSF. TANKER DRAIN 20 GALLONS FROM UNIT. UNIT HOLDS APPROX 190 GALLONS. APPROX 170 GALLONS MISSING. HE SEE OIL MIXED IN DIRT. 2/03/03 13:45 HRS. AFTER DRAINING TRANSFORMER (AS PER PREVIOUS UPDATE) HE PERFORMED A PRESSURE TEST OF THE EMPTY TRANSFORMER AND IT DID NOT HOLD PRESSURE.UPDATE 2/3/03 15:00 HRS. CREW FOUND AN EARTHEN SUMP IN STRUCTURE.UPDATE 2-3-03 1700 HRS B. BAMONTE OS FLUSH DEPT

VAULT #6100 (Continued) **S106011162**

REPORTS INITAL CLEANUP IS COMPLETED. HE DOUBLE WASHED STRUCTUREWITH BIO-JEN 760 . THEY REMOVED ALL LIQUIDS WITH HIS VACTOR. THEY FOUND AND EARTHERN SUMP WITH NO SIGNS OF OIL INTHEM. HE CEMENTED SAME. THEY REMOVED 5 DRUMS OF SOLID WASTE FROM STRUCTURE. ASTORIA TRANSPORTATION PICKED UPDRUMS. TAG REMAINS IN PLACE UNTILL TRANSF IS REMOVED ,UPDATE 2/4/03 10:55 HRS. -- R. LACASSE & A. STUBBS ON VACTOR 60724 REPORTS UNIT WAS REMOVED BY EQUIPMENT. THEY DOUBLE WASHEDSTRUCTURE WITH BIOGEN 760, FOUND SUMP WAS SEALED, AND REMOVED ENV. STOP TAG #26273. CLEANUP 100% COMPLETE. Supv. Robert J. Hutchinson reports that at 1800 Hrs on 2/4/03 while watching truck 60724 dump at Farrington St. saw a heavy sheen of oil come from the load of the truck. The truck was used on the 7-3 shift to complete incident 147010. A 4" diameter 8' long oil boom was placed in the North manhole to prevent the sheen from entering the water treatment facility. Dump personnel was ordered to absorb as much of the sheen as possible and clean up remaining area. At 2000 Hrs. area was completely clean.

Remarks: Transformer in vault was leaking - vaccuum truck was sent to clean it out - transformer contained 190 gallons - vaccuum only got 20 gallons from transformer - the rest of the oil is mixed in with dirt and leaves

Hazardous Waste Summary:
Waste code: D000
Waste name: Not Defined

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D008
Waste name: LEAD

Waste code: D018
Waste name: BENZENE

Waste code: D039
Waste name: TETRACHLOROETHYLENE

Violation Status: No violations found

DEC Memo:	06/28/89 Unico removed 12X550s. After excavating the USTs, a strong gasoline odor was detected in soil beneath the underlying bottom slab. At that time, excavation was halted for safety reasons. The FDNY temporarily closed the S/S until it determined that vapors were not present. An additional 3' of contaminated soil was removed from the bottom of the excavation. When excavation was halted, approx 140yds soil was removed to a depth of 16'bgs. Soil at bottom continued to show evidence of contamination.7/3/89 Existing three USTs tightness tested and passed.7/89 Benzene: 1890ppb(MW-1), 5556ppb(MW-2), 773ppb(MW-3), 2ppb(MW-4).8/26/93 MW-3 and MW-4 had a sheen. MW-1 had 2100ppb and MW-2 had 50ppb benzene.9/14-9/15/93 Installed MW-5 & 6.9/29/93 Amoco Meeting- Amoco needs to address soil and GW contamination.10/14-10/15/93 Installed MW-7 & 8.10/26/93 MW-3 had LNAPL. MW-1 had 1500ppb, MW-2 had 790ppb, MW-4 had 9700ppb, MW-5 had 7000ppb, MW-6 had 7900ppb, MW-7 was ND and MW-8 had 13ppb benzene.Now free product in three MWs. Did product pumpdown recharge test. Will be getting reports. DEC told Amoco they need to do a more aggressive remediation. 8/93 A soil gas survey was conducted which indicated that the highest concentrations of VOCs in soil vapor were adjacent to the pump islands and tank cavity. 1997-2001 12 VEFR events were conducted on extraction well(VEW-1) and monitoring well(MW-13), which recovered an estimated 759lbs of hydrocarbon vapor and 4.5gal of LNAPL. 3/14/03 REASSIGNED FROM ROMMEL TO VOUGHT.12/4/03 Reassigned from Vought to Foley. Most recent monitoring report (2Q2003) shows LNAPL in MW-6 (0.03'), MW-9 (0.72'), MW-13 (0.53') and VEW-1 (1.38'). Max BTEX at MW-13 at 159,520ppb. Max MTBE at MW-4 at 82,400ppb. Not fully delineated. Need stip.2/3/04 Sent stip to C. Wein, BP. See spill #0010597/9830011 at 65-09 Queens Blvd.3/19/04 Received 3Q and 4Q reports. Feet of LNAPL detected in four wells in

AMOCO SERVICE STATION 441 (Continued) **1000174740**

fourth quarter. High dissolved concentrations.3/24/04 Stip effective today. Delta will conduct product bail-down test and proposes to install a passive recovery bailer in the wells that contain LNAPL. Investigation summary report due 5/24/04.4/16/04 1Q 2004 monitoring report received. LNAPL in MW-6 (3.18'), in MW-9(0.59'), in MW-13(0.53') and in VEW-1(2.89').Total BTEX ND(MW-10, 11, 12, 14) to 146,610ppb(MW-13. MTBE ND(MW-12) to 103,000ppb (MW-13).5/7/04 Portfolio meeting: Will submit report for SVE pilot completed on VEW-1. Very heterogeneous soils, tight. After 12hrs, recovery drops to 0. SVE to address vadose. EFR didn't work for LNAPL recovery. Need to assess dissolved technologies. Submitting RAP sometime this quarter but unsure of proposal at this time.5/24/04 Subsurface Assessment report received. Two additional wells, MW-16 and MW-17 were drilled from 34.5 to 37.5'bgs. Soil samples collected did not identify VOCs above cleanup objectives. 17 groundwater samples collected. LNAPL was detected in four wells, MW-6(3.09'), MW-9(0.43'), MW-13(0.58'),MW-16(0.03'), and VEW-1(2.84'). Total BTEX ranged from ND(MW-12) to 122,810ppb(MW-13). MTBE ranged from ND(MW-7, MW-12) to 83,800ppb(MW-13).On 5/5/04, Delta conducted a baildown test on monitoring well MW-6 to determine the transmissivity of the formation with respect to LNAPL. Delta plans to install passive skimmers in MW-6, MW-9, and MW-13 to recover LNAPL(as per the stip).SVE pilot results to be submitted under separate cover. Delineation may not be possible across 65th Pl due to interference with BQE. 7/13/04 SVE feasibility pilot testing, analysis and report submitted. The test showed that there is a sufficient quantity of hydrocarbons available for recovery, but low permeability soils limit the effectiveness of SVE as a remedial option. Delta will continue to monitor GW and further evaluate SVE to determine its applicability.8/6/04 Received 2Q04 monitoring report. LNAPL in MW-6(3.09'), VEW-1(2.89'), MW-9(.43'), MW-13(.58') and MW-16(.03'). Passive recovery bailers have been installed in wells with LNAPL.11/5/04 Requested additional delineation crossgradient of MW-5, MW-16 and MW-17. Also upgradient of MW-9. The BQE runs below 65th St. Delta assessed these options previously and determined that it was too dangerous to install on 65th St. The upgradient well would be on the other side of a four lane roadway and is probably too far to be helpful. Approved delineation and requested RAP be submitted as per stip. RAP due 12/20/04.1/20/05 Email from B. Fisher, Delta. Delta conducted the MPE pilot and are currently evaulating the results. The pilot test report will be completed by 1/21/05 and assuming the results are favorable, the RAP will be submitted by 1/28/05.2/2/05 Received pilot test results and RAP for MPE.4/5/05 4Q04- LNAPL-0.16'(MW-16), 0.11'(MW-18) and 0.45'(VEW-1). BTEX ranged from ND(MW-10,11,12,14) to 360800ppb(MW-18). MTBE ranged from ND(MW-12) to 134000ppb(MW-4). DTW 25-34'bgs.4/26/05 3Q04- 0.04'(MW-16), 0.43'(VEW-1). BTEX from ND(MW-10,12,14) to 78420ppb(MW-4). MTBE from ND(MW-7,12) to 106000ppb(MW-4). DTW 25-34'bgs.4/27/05 Portfolio meeting- GW 27-30'bgs. Tight soils. Impacts at tank mat suspected to be source. In saturated and capillary fringe zone. Passive skimmers in MW-6,9,13 removed 3gal LNAPL from 6/04-8/04. Off-site wells MW-16,17. SVE had limited ROI at EW-1. MPE pilot on MW-13. 10 extraction wells. Isolating points b/c of tight soils and utilizing skimmers.MPE pilot showed 2.52ft of drawdown in VEW-1 and 0.25ft in MW-5. VEW-1 and MW-5 are located 5.5ft and 50.5ft from MW-13(pilot extraction well). Approx 170gal of water was removed from MW-13 over 8hrs. 0.35gpm was achieved. No measurable LNAPL was recovered. A 10HP

AMOCO SERVICE STATION 441 (Continued) **1000174740**

LRP connected to a 1" PVC stinger, set approx 1.5' below the water table, effectively influences soil vapor within a 65ft by 25ft lateral area from MW-13.Contaminant mass is estimated with 285,450 cubic feet of soil, 1323gal of LNAPL, 7954lbs of total VOCs (16lbs in soil and 7938lbs LNAPL).7/11/05 Approved RAP for MPE. To be implemented within 45days(8/25/05).9/16/05 1Q05- DTW 25.5-33.7'bgs. 0.51' LNAPL in MW-18, 0.58' in VEW-1. BTEX from ND(MW-10,14,15) to 247,990ppb(MW-18). MTBE from ND(MW-12)to 110000ppb(MW-13).9/19/05 Email from B. Fisher- MPE is currently not operational; however, since the NYSDEC's July 11, 2005 approval of Delta's MPE RAP, have been initiating the construction of the system. Building, permitting, and installing the system has taken longer than expected. The MPE system and housing for the system have been constructed off-site; however, several of the system components, including the LRP pump and some of the electronics, have had considerable lead times which have taken Delta longer than expected to acquire. In addition, an electrical upgrade is required to the service station; therefore, Delta submitted an application to New York City's electrical permitting office to get the appropriate permit to upgrade the electric service, but unfortunately the permit has a lead time of approximately 50-80 days from the time the application is submitted. They are expectingthe permit by mid to late October. Delta plans to finish the construction of the MPE system and housing with the outstanding components, relocate the system to the site, hook the MPE system up with each extraction well line, and provide the appropriate fencing/protection for the system and carbon units on-site. Once the electrical upgrade permit is acquired in mid to late October, Delta expects to start up the MPE system. 9/29/05 2Q05- DTW 23.68 to 33.42 ft. 0.01' LNAPL detected in MW-6 and 0.34' in MW-18. BTEX from ND(MW-10,11,12) to 122480ppb(MW-13). MTBE from ND(MW-12) to 114000ppb(MW-13).10/3/05 Email from D. Taylor, Delta. Will be working in coming weeks for the proposed MPE system. Sent letter for obtaining permits to install piping under sidewalk. 12/6/05 3Q05- DTW 24.61-33.80'bgs. 0.82' LNAPL in MW-18 and 0.80' in VEW-1. BTEX from ND(MW-1,3,7,8,11,12,14,VEW-1) to 226710ppb(MW-18). MTBE from ND(MW-7,8) to 120000ppb(MW-5).3/16/06 Met with BP and Delta. Dave Taylor of Delta is project manager. DTW 27-30'bgs, transmissivity 8.96X10^-7 ft2/min. MW-16,17,18 installed this year. Limited vadose zone contamination. Delay due to Con Ed electric drop. MPE system startup 3/06. There are 5-6 extraction wells. System generates 27"Hg(35cfm) but Delta plans to concentrate on one well ar a time and then optimize by ROI readings.6/8/2006 - Feng - project reassigned to RJFeng. (RJF)8/3/20006 - Feng - 1Q2006, 6/5/2006, by Delta. The site is an active gasoline station. As of sampling on 1/31/2006, groundwater flows to south at depth of 23.77' to 33.45' bg. 18 monitoring wells and 1 vapor extraction well. W-1, 2,752 ppb BTEX (1,430 ppb B, 429 ppb T, 383 ppb E, 510 ppb X), 28,000 ppb MTBE. W-2, 6.6 ppb BTEX , 3,350 ppb MTBE. W-3, 23,790 ppb BTEX (5,290 ppb B, 12,600 ppb T, 1,070 ppb E, 4,830 ppb X), 32,500 ppb MTBE. W-4, 79,210 ppb BTEX (11,800 ppb B, 55,700 ppb T, 1,890 ppb E, 9,820 ppb X), 92,700 ppb MTBE. W-5, 6,389 ppb BTEX (991 ppb B, 356 ppb T, 892 ppb E, 4,150 ppb X), 5,550 ppb MTBE. W-6, 25,665 ppb BTEX (2,130 ppb B, 14,100 ppb T, 975 ppb E, 8,460 ppb X), 39,300 ppb MTBE. W-7, BTEX ND, 0.36J MTBE. W-8, 90.5 ppb BTEX, 48.1 ppb MTBE. W-9, 47,510 ppb BTEX (1,730 ppb B, 30,700 ppb T, 1,980 ppb E, 13,100 ppb X), 29,600 ppb MTBE. W-10, 25 ppb BTEX, 6,150 ppb MTBE. W-11, BTEX ND, 2.5 ppb MTBE. W-12, BTEX ND, less than 1 ppb MTBE. W-13, dried. W-14, BTEX ND, 6.2

AMOCO SERVICE STATION 441 (Continued) **1000174740**

ppb MTBE. W-15, 0.77 ppb BTEX, 2.1 ppb MTBE. W-16, 33,705 ppb BTEX (225 ppb B, 21,800 ppb T, 1,700 ppb E, 9,950 ppb X), 245 ppb MTBE. W-17, 724 ppb BTEX, 133 ppb MTBE. W-18, 37,766 ppb BTEX (2,940 ppb B, 28,000 ppb T, 966 ppb E, 5,860 ppb X), 33,700 ppb MTBE. VEW-1, 175,560 ppb BTEX, (11,000 ppb B, 150,000 T, 2,260 ppb E, 12,300 ppb X), 39,100 ppb MTBE. (RJF)9/25/2006 - Feng - Quarterly Monitoring Report, 2Q2006, 7/6/2006, by Delta. Groundwater sampling ang gauging on 4/18/2006. DTW 24.89' to 33.66' and flows to south-southwest. LNAPL present in MW-6 (0.68'), MW-18 (0.58') and VEW-1 (1.06'). Total BTEX range from ND (MW-2, MW-10, MW-11, and MW-15) to 225,880 (VEW-1). MTBE range from 2.3 (MW-11) to 119,000 (MW-4). (RJF)9/28/2006 - Feng - Portfolio Meeting with BP and Delta. MPE started operating on 3/2006. Tied clay, less opportunity to transport and also recovery. Currently system running at: 22" Hg and between 5 and 65 SCFM at various extraction wells (MW-1, 6, 13, 16, 17, and 18). Cummulative system recovery to date (after 718 hours operating): 3.9 lbs BTEX, 37.7 lbs MTBE, 327 lbs TPH, 18,836 gallons of impacted groundwater treated (primarily from MW-17), no LNAPL recovered. Will continued to optimize the system. (RJF)2/8/2007 - Feng - Quarterly Remedial System Operation and Maintenance Report, 2Q2006, 1/9/2007. MPE system started up 6/13/2006. O&M site visit on 6/15/2006, 1 of 6 extraction wells (MW-18) was operating. Influent and effluent vapor and groundwater samples taken. Total 27.45 lbs of BTEX, 3.19 lbs of MTBE and 241.85 lbs of TPH recovered after 48 hours of system operation. Delta plan to continue MPE system operation. (RJF)2/8/2007 - Feng - 3Q2006, 1/25/2007, by Delta. Groundwater sampled and gauged 7/25/2006. 17/19 monitoring wells. DTW 24.11' to 33.57' bg. Flows south-southwest. LNAPL in MW-6 (0.02'), MW-16 (0.12') and VEW-1 (0.56'). MW-1, 3,099 ppb BTEX, 18,000 ppb MTBE. MW-2, BTEX ND, 6,110 pb MTBE. MW-3, 48,830 ppb BTEX, 39,500 ppb MTBE. MW-4, 71,710 ppb BTEX, 83,600 ppb MTBE. MW-5, 5,602 ppb BTEX, 3,250 ppb MTBE. MW-6, 36,280 ppb BTEX, 38,200 ppb MTBE. MW-7, ND. MW-8, 84 ppb BTEX, 62.8 ppb MTBE. MW-9, 31,950 ppb BTEX, 23,800 ppb MTBE. MW-10, BTEX ND, 6,340 ppb MTBE. MW-11, ND. MW-12, ND. MW-13, insufficient water. MW-14, BTEX ND, 3.6 ppb MTBE. MW-15, BTEX ND, 0.59 ppb MTBE. MW-16, 65,590 ppb BTEX, 214 ppb MTBE. MW-17, 281 ppb BTEX, 53.4 ppb MTBE. MW-18, 52,790 ppb BTEX, 76,600 ppb MTBE. (RJF)6/13/2007 - Feng - 4Q2006, 2/13/2007. Groundwater sampled 10/18/2006. 18/19 monitoring wells were sampled. DTW 25.33' to 33.62' bg. Flows to south-southwest. LNAPL in MW-6 (0.19'), MW-18 (0.01') and VEW-1 (0.01'). MW-1, 3,554 ppb BTEX, 10,400 ppb MTBE. MW-2, BTEX ND, 4,800 ppb MTBE. MW-3, 48,740 ppb BTEX, 42,800 ppb MTBE. MW-4, 102,970 ppb BTEX, 109,000 ppb MTBE. MW-5, 7,164 ppb BTEX, 2,450 ppb MTBE. MW-6, 43,080 ppb BTEX, 41,100 ppb MTBE. MW-7, ND. MW-8, 48 ppb BTEX, 75 ppb MTBE. MW-9, 29,200 ppb BTEX, 21,700 ppb MTBE. MW-10, BTEX ND, 134 ppb MTBE. MW-11, 10.2 ppb MTBE. MW-12, ND. MW-13, not sampled. MW-4, ND. MW-15, ND. MW-16, 47,354 ppb BTEX, 241 ppb MTBE. MW-17, 486 ppb BTEX, 579 ppb MTBE. MW-18, 70,920 ppb BTEX, 72,200 ppb MTBE. VEW-1, 177,450 ppb BTEX, 54,100 ppb MTBE. (RJF)7/20/2007 - Feng - 1Q2007, 6/15/2007. Groundwater sampled 1/4/2007. 17/19 monitoring wells were smapled. DTW 25.42' to 33.59' bg. Flows to south-southwest. No LNAPL. MW-1, 2,687 ppb BTEX, 11,800 ppb MTBE. MW-2, 4.3 ppb BTEX, 6,500 ppb MTBE. MW-3, 41,890 ppb BTEX, 37,400 ppb MTBE. MW-4, 95,030 ppb BTEX, 87,800 ppb MTBE. MW-5, 4,910 ppb BTEX, 3,320 ppb MTBE. MW-6, 238 ppb BTEX, 349 ppb MTBE. MW-7, 0.65 ppb BTEX, less than 1 ppb MTBE. MW-8, 9.6 ppb BTEX, 51.2 ppb MTBE. MW-9, 22,200 ppb BTEX, 21,200 ppb MTBE. MW-10, 8.6 ppb BTEX, 50.6 ppb MTBE. MW-11, BTEX ND, 31.3 ppb MTBE.

AMOCO SERVICE STATION 441 (Continued) **1000174740**

MW-12, 3.0 ppb BTEX, less than 1 ppb MTBE. MW-13, not accessible. MW-14, 4.7 ppb BTEX, 2.6 ppb MTBE. MW-15, not accessible. MW-16, 68,134 ppb BTEX, less than 200 ppb MTBE. MW-17, 383 ppb BTEX, 376 ppb MTBE. MW-18, 63,530 ppb BTEX, 77,000 ppb MTBE. VEW-1, 193,730 ppb BTEX, 44,700 ppb MTBE. (RJF)12/12/2007 - Feng - 2Q2007, 8/2/2007. Active service station. Groundwater gauged and sampled 4/5/2007. The site is being remediated via the execution of Multi Phase Extraction events on a regular basis. 17/19 monitoring wells were gauged and sampled. DTW 25.41' to 33.61' bg. Flows to south-southwest. LNAPL in VEW-1 (0.01'). BTEX range ND to 193,720 ppb (VEW-1). MTBE range ND to 67,400 ppb (MW-4). (RJF)1/9/2008 - Feng - 3Q2007, 10/29/2007. Active Service Station. The monitoring well network was gauged and sampled on 7/27/2007. The site is being remediated via the execution of Multi Phase Extraction events. 18/19 monitoring wells were gauged. DTW 24.62' to 33.30' bg. Flows to south-southwest. No LNAPL. 17 wells were sampled. BTEX range ND to 43,700 ppb (VEW-1). MTBE range ND to 43,700 ppb (MW-4). (RJF)2/13/2008 - Feng - 4Q2007, 11/16/2007. Active service station. The monitoring well network was gauged and sampled on 10/9/2007. The site is being remediated via the execution of Multi Phase Extraction events. 18/19 monitoring wells were gauged. DTW 24.83' to 33.54' bg. Flows to south-southwest. LNAPL in MW-18 (0.04') and VEW-1 (0.03'). 17 monitoring wells were sampled. BTEX range ND to 142,330 ppb (VEW-1). MTBE range ND to 50,300 ppb (MW-4). 1Q2008, 2/7/2008. Active Service Station. The monitoring well network was gauged and sampled on 1/16/2008. The site is being remediated via the execution of MPE events. 18 wells were gauged. DTW 24.93' to 33.51' bg. Flows to south-southwest. LNAPL in MW-18 (0.07'). 17 wells were sampled. BTEX range ND to 123,100 ppb (VEW-1). MTBE range ND to 38,000 (MW-3). (RJF)6/18/2008 - Feng - Portfolio meeting with BP and Delta. The permanent MPE system was installed and started in 6/2006. During the past 2 years, the system was on and off due to the cooling problem. The system will be continued to run and groundwater monitoring. System optimization will be made. (RJF)10/29/2008 - 2Q2008, 9/11/2008, by Delta. Active service station. the monitoring well network ws gauged and sampled on 4/30/2008. the site is being remediated via the MPE system. 19 wells were gauged. NO LNAPL. DTW 24.91' to 36.62' bg. flows to south-southwest. 18 wells were sampled. MW-13 was not sampled because it was dry. BTEX range ND to 126,600 ug/L (MW-4). MTBE range ND to 69,000 ug/L (MW-18). 3Q2008, 9/29/2008, by Delta. Active service station. The monitoring well network was gauged and sampled on 7/23, 24/2008. The site is being remediated via the MPE system. 16 wells were gauged. MW-8 and Mw-15 had no access, MW-13 was obstructed. No LNAPL. DTW 24.90' to 33.53' bg. Flows to south-southwest. 19 wells were sampled. BTEX range ND to 122,600 ug/L (MW-4). MTBE range ND to 52,000 ug/L (MW-18). (RJF)3/3/2009 - 4Q2008, 11/13/2008, by Delta. Active service station. The monitoring well network was gauged and sampled on 10/10/2008. The site is being remediated via the MPE system. 19 wells were gauged. NO LNAPL. DTW 24.93' to 33.66' bg. Flows to south-southwest. 19 wells were sampled. BTEX rnage ND to 103,500 ug/L (MW-4). MTBE range ND to 61,000 ug/L. (RJF)5/22/2009 - Reviewed Drilling Work Plan, dated 3/31/2009, by Delta. Delta proposes to install 2 monitoring wells, SHARA due within 90 days of the approval. Have comment on the proposed well MW-20 location. (RJF)8/5/2009 - Approve the Drilling Work Plan, according to the meeting on 7/30/2009, proposed MW-20 will be relocated to the south of MW-11. Letter to BP and Delta. SHARA is due 11/2009. (RJF)6/2/2010 - 4Q2009, 1/17/2010, by EnviroTrac. Active BP service

AMOCO SERVICE STATION 441 (Continued) **1000174740**

station. The monitoring well network was gauged and sampled on 10/23/2009. The site is being remediated via the multiphase extraction system and monthly product recovery events. A new offsite monitoring well was installed and a report summarizing the details of the installation will be submitted by Delta under separate cover. 20 wells were gauged. LNAPL in VEW-1 (0.32'). DTW 25.31-33.78' bg. Flows to south-southwest. 19 wells were sampled. Max benzene 9,900 ug/L (MW-4). Max BTEX 95,900 ug/L (MW-13). Max MTBE 90,000 ug/L (MW-18). 1Q2010, 4/12/2010, by EnviroTrac. The monitoring well network was gauged and sampled on 1/29/2010. This site is being remediated via the MPE system and monthly product recovery events. 1 monitoring well MW-20 was installed in 12/2009, and SHARA will be submited. 20 wells were gauged. LNAPL in MW-18 (0.06') and VEW-1 (0.44'). DTW 24.89-33.63' bg. Flows to south-southwest. 18 wells were sampled. MW-18 and VEW-1 with LNAPL, MW-15 with immobile vehicle, not sampled. Max benzene 9,700 ug/L (MW-4). Max BTEX 56,000 ug/L (MW-4). Max MTBE 73,000 ug/L (MW-9). MW-20, low/ND.6/15/2010 - Subsurface Hydrocarbon Assessment Report Addedum, dated March 30, 2010, by Delta. On 9/16/2009 and 12/29/2009, MW-19 and MW-20 were installed respectively using a hollow stem auger drilling rig equipped with a split-spoon sampler. 3 soil samples were collected. MW-19 (20-20.5'), 57J ug/kg total VOCs. MW-19 (29-29.5'), 310 ug/kg MTBE, 874 ug/kg total VOCs. MW-20 (26-26.5'), VOCs ND. Groundwater samples were collected on 1/29/2010, unit in ug/L. MW-1, 182.4 BTEX, 530 MTBE. MW-2, 4.77 BTEX, 650 MTBE. MW-3, 7,640 BTEX, 12,000 MTBE. MW-4, 56,000 BTEX, 19,000 MTBE. MW-5, 3,033 BTEX, 200 MTBE. MW-6, 10,760 BTEX, 43,000 MTBE. MW-7, BTEX ND, less than 0.50 MTBE. MW-8, BTEX ND, 31 MTBE. MW-9, 15,800 BTEX, 73,000 MTBE. MW-10, 0.77J BTEX, 4.4 MTBE. MW-11, 3.7 BTEX, less than 0.50 MTBE. MW-12, 2.85 BTEX, less than 0.50 MTBE. MW-13, 51,200 BTEX, 28,000 MTBE. MW-14, 4.7 BTEX, less than 0.50 MTBE. MW-15, 8,115 BTEX, less than 2.5 MTBE. MW-17, 42.5 BTEX, 17 MTBE. MW-19, 440 benzene, 4,500 toluene, 380 ethylbenzene, 2,050 xylenes, 7,370 BTEX, 3,100 MTBE. 58 isopropylbenzene, 190 n-propylbenzene, 12J p-isopropylbenzene, 1,200 1,2,4-trimethylbenzene, 480 1,3,5-trimethylbenzene, 37 n-butylbenzene, 22J sec-butylbenzene, 55 naphthalene, 12,524 total VOCs. Delta recommends expanding the existing groundwater monitoring network with an additional well MW-21 to be installed along the south side of Queens Blvd and to the west MW-19. Groundwater sampling at the existing monitoring well will continue on a quarterly monitoring schedule. 6/21/2010 - email to Delta. DEC require delineation in the north of MW-18, MW-9 and MW-19, at the median/divider in Queens Blvd or across Queens Blvd in addition to the MW-21 that being proposed. work plan 7/2010. 7/26/2010 - 2Q2010, 7/14/2010, by Delta. Gauged and sampled on 4/21/2010. LNAPL in MW-18 (0.05'). Flows to south southwest. Max BTEX 94,900 ug/L (MW-4). Max MTBE 42,200 (MW-5). 08/06/2010: This spill was temporarily (for 6 months) transferred to A. Doronova. - AD12/06/2010: Received a pdf copy of the 3rd quarter 2010 groundwater monitoring report. DL the report to eDocs. AD12/23/2010: Reviewed the report. The monitoring well network was gauged and sampled on July 28, 2010. Total 18 wells were sampled. MW-15 was not sampled due to no access. BTEX and MTBE concentrations are ND and very low in 7 wells: MW-7 (ND and 0.5ppb), MW-8 (5.7ppb and 16ppb), MW-11 (0.5ppb and 0.5ppb), MW-12 (ND and 0.5ppb), MW-14 (ND and 0.5ppb), MW-17 (7ppb and 12ppb) and MW-20 (ND and 0.5ppb). Moderate levels of BTEX and MTBE were noted in 4 wells: MW-1 (394ppb and 430ppb), MW-2 (2.4ppb and 260ppb), MW-5 (1,865ppb and 130ppb) and

AMOCO SERVICE STATION 441 (Continued) **1000174740**

MW-10 (ND and 3,300ppb). Significant concentrations of BTEX and MTBE were detected in the following wells: MW-3 (16,000ppb and 8,300ppb), MW-4 (42,600ppb and 5,800ppb), MW-6 (9,500ppb and 42,000ppb), MW-9 (11,060ppb and 45,000ppb), MW-13 (40,000ppb and 58,000ppb), MW-16 (11,700ppb and 6ppb) and MW-19 (22,500ppb and 6,800ppb). Max BTEX is 42,600 ug/L (MW-4) and max MTBE is 58,000 ug/L (MW-13). LNAPL was detected in wells: VEW-1 (0.03') and MW-18 (0.05'). DTW 25.31-33.78' bg. Flows to south-southwest. Delta recommends to continue groundwater monitoring and remedial activities at the site.
AD01/05/2011: Received a grounwater monitoring report for 4th quarter of 2010. DL the pdf copy of the report to eDocs. Will review.
AD02/09/2011: Reviewed the report. The monitoring well network was gauged and sampled on October 11, 2010. Total 20 wells were sampled. MW-18 was not sampled due to a presence of free product (0.12"). BTEX and MTBE concentrations were ND or very low in 8 wells: MW-1 (17.6ppb and 150ppb), MW-2 (1.9ppb and 99ppb), MW-7 (ND and 0.5ppb), MW-8 (2ppb and 21ppb), MW-11 (1.2ppb and 0.5ppb), MW-12 (ND and 0.5ppb), MW-14 (ND and 0.5ppb), MW-17 (2.5ppb and 6ppb) and MW-20 (0.62ppb and 0.5ppb). Moderate levels of BTEX and MTBE were noted in 2 wells: MW-5 (1,404ppb and 240ppb) and MW-10 (2.4ppb and 3,000ppb). Significant concentrations of BTEX and MTBE were detected in the following wells: VEW-1 (111,400ppb and 35,000ppb), MW-3 (11,300ppb and 5,600ppb), MW-4 (20,800ppb and 3,800ppb), MW-6 (4,980ppb and 36,000ppb), MW-9 (27,300ppb and 63,000ppb), MW-13 (39,400ppb and 58,000ppb), MW-16 (12,330ppb and 0.50ppb) and MW-19 (12,690ppb and 5,600ppb). Max BTEX is 111,400 ug/L (VEW-1) and max MTBE is 56,000 ug/L (MW-13). DTW 25.31-33.78' bg. Flows to south-southwest. Delta recommends to continue groundwater monitoring and remedial activities at the site.
AD4/8/2011 - spill transferred back to JFeng. 4/22/2011 - 1Q2011, 4/5/2011, by Anteagroup. The groundwater was sampled on 1/13/2011. Product in VEW-1 (0.03'), MW-18 (0.14'). High level of BTEX and MTBE in MW-3 (7,020 ug/L BTEX, 3,300 MTBE), MW-4 (14,900 BTEX, 3,700 MTBE), MW-5 (1,588 BTEX, 140 MTBE), MW-6 (4,430 BTEX, 36,000 MTBE), MW-9 (25,100 BTEX, 62,000 MTBE), MW-13 (33,140 BTEX, 53,000 MTBE), MW-16 (16,535 BTEX, less than 5.0 MTBE), MW-19 (17,310 BTEX, 4,900 MTBE). Delta intends to continue groundwater monitoring and remediation activities at the site. email to Chris Meyer " I need some updates on this one. Is the MPE system back on operation now? And also have you submitted any work plan for the wells installation in Queens Blvd or across Queens Blvd? The 1Q2011 quarterly report did not show any new wells nor any remediation activities are going on. There are product in some wells and high level of BTEX and MTBE in multiple wells. "9/23/2011 - 2Q2011, 8/25/2011, by Antreagroup. The groundwater samples were collected on April 27, 2011. 20 wells were sampled. 20 wells were sampled. High BTEX and MTBE in multiple wells. LNAPL in MW-18 (0.01'). MW-3, 15,000 ug/L BTEX, 8,300 ug/L MTBE. MW-4, 65,800 ug/L BTEX, 7,200 ug/L MTBE. MW-6, 6,730 ug/L BTEX, 40,000 ug/L MTBE. MW-9, 27,300 ug/L BTEX, 62,000 ug/L MTBE. MW-13, 28,300 ug/L BTEX, 10,000 ug/L MTBE. MW-16, 8,710 ug/L BTEX, less than 2.5 MTBE. MW-19, 5,770 ug/L BTEX, 2,800 ug/L MTBE. MPE system is operational onsite. Vapor and water influent and effluent samples were collected. Approximately 9,650 gallons of impacted water were treated by the MPE system during 2Q2011. 9/26/2011 - email from Gordon Hinshalwood of Anteagroup "I wanted to let you know that we have encountered operational issues with our two dual-phase extraction systems located at 65-10 Queens Blvd and at 3055 Westchester Ave. Both systems are currently shut down as a result of

AMOCO SERVICE STATION 441 (Continued) **1000174740**

these issues. These systems have both historically recovered significant quantities of hydrocarbons from the subsurface, but we have more recently been challenged with maintenance/ageing performance issues, and are therefore actively looking at other possible solutions to complete the site remediation efforts. We will follow with additional notification as we determine the appropriate path forward." 1/10/2011 - 3Q2011, 12/2/2011, by Antea Group. The groundwater samples were collected on July 14, 2011. 20 wells were sampled. LNAPL in MW-18 (0.10'), VEW-1 (0.05'). High BTEX and MTBE in multiple wells. MW-3, 29,300 ug/L BTEX, 10,000 ug/L MTBE. MW-4, 48,200 ug/L BTEX, 3,300 ug/L MTBE. MW-6, 6,160 ug/L BTEX, 37,000 ug/L MTBE. MW-9, 20,600 ug/L BTEX, 66,000 ug/L MTBE. MW-13, 30,470 ug/L BTEX, 49,000 ug/L MTBE. MW-16, 5,567 ug/L BTEX, less than 2.5 ug/L MTBE. MW-19, 8,280 ug/L BTEX, 4,100 ug/L MTBE. LNAPL was found in the liquid separator tank and the origin of the LNAPL was found to be from the liquid ring pump. The MPE system is currently non operational. The system has demonstrated decreasing hydrocarbon recovery trends over time, and recent operational difficulties have presented significant challenges in maintaining system operation. Alternative methods of site remediation are under consideration at this time. 8/16/2012 - 1Q2012, 4/30/2012, by GES. The groundwater was sampled on 1/24/2012. LNAPL in MW-18 (0.10'), not sampled. LNAPL in MW-6 and MW-9 (Sheen), the was was purged and sampled. DTW 33.70 (MW-15) to 24.41 (MW-12) below TOC. Flows to southwest. MW-19, 1,370 BTEX, 5,700 MTBE. VEW-1, 205,100 BTEX, 9,300 MTBE. MW-6, 12,700 BTEX, 57,000 MTBE. MW-9, 20,140 BTEX, 37,000 MTBE. MW-13, 25,010 BTEX, 15,000 MTBE. MW-3, 26,100 BTEX, 11,000 MTBE. MW-4, 48,800 BTEX, 5,500 MTBE. MW-1, 49 BTEX, 120 MTBE. MW-15, BTEX ND, 32 MTBE. MW-16, 5,643 BTEX, MTBE ND. MW-5, 1,298 BTEX, 86 MTBE. MW-17, BTEX ND, 2.2 MTBE. MW-2, 2 BTEX, 160 MTBE. The next sampling will be in 4/2012. 9/6/2012 - Reviewed Feasibility Study Work Plan, dated 8/23/2012, by GES. GES propose to install 2 SVE wells or monitoring wells, and 2 AS wells for the Vacuum Enhanced Groundwater Extraction (VEGE) and SVE/AS pilot test. Email to BP/GES. No comment provided on the pilot test part and let them plan ahead with the pilot test. Comments were given on the Generic Site Investigation Work Plan. 1) additional soil sample for vertical delineation; 2) drilling depth; 3) Investigation Derived Waste. see eDoc. According to GES's email, they might start the pilot 9/17/2012. 1/4/2013 - 3Q2012, 10/31/2012, by GES. The groundwater was sampled on 7/17/2012. DTW 24.27 (MW-12) to 33.62 (MW-7). LNAPL in MW-18 (0.49'). Flows to southwest. MW-19, 2,890 BTEX, 4,400 MTBE. VEW-1, 123,400 BTEX, 15,000 MTBE. MW-6, 8,090 BTEX, 52,000 MTBE. MW-9, 15,940 BTEX, 92,000 MTBE. MW-13, 12,180 BTEX, 6,800 MTBE. MW-10, 150 MTBE. MW-4, 26,200 BTEX, 7,500 MTBE. MW-3, 23,900 BTEX, 8,800 MTBE. MW-16, 6,909 BTEX. MW-5, 2,849 BTEX, 320 MTBE. MW-2, 1.82 BTEX, 190 MTBE. On 9/11-20/2012, conducted drilling activities which included the installation of 2 monitoring wells (MW-A and MW-B) and 2 sparge point wells (SP-1 and SP-2) in accordance with the August 2012 FSWP. Will conduct the SVE/AS and VEGE pilot testing. 1/10/2013 - email to Eddie Savarese of GES for product recovery. 1/14/2013 - response from Eddie Savarese of GES " GES conducted a Pilot Test at this site and is in the process of preparing a Summary Report to the NYSDEC. In the interim, GES proposes to install product passive skimmers and/or absorbent product recovery socks at monitoring wells MW-18, MW-A and MW-B where product is observed. In addition, GES will install a product recovery drum with an overpack, vent, and grounding rod to store recovered LPH."

AMOCO SERVICE STATION 441 (Continued) **1000174740**

5/2/2013 - Reviewed Feasibility Study Report, dated 3/18/2013, by GES. In 9/2012, two extraction wells MW-A and MW-B, and two Air Sparge wells SP-1 and SP-2 were installed. And between 11/27-28/2012, feasibility testing activities were conducted using GES's Data Acquisition and Processing Laboratory (DAPL). The results of the feasibility study indicated that SVE/AS can be feasibly implemented at the site and the VEGE is not an appropriate remedial alternative. GES proposed to conduct additional delineation of the location, extent, and magnitude of the trapped product and delineation at the north and west of the canopy and the southeast of monitoring well MW-B before an appropriate remedial strategy for the site could be determined because of the increase thickness was observed during the January 2013 groundwater sampling event. Reviewed 4Q2012 and 1Q2013. In 2/2013, passive skimmers were installed in MW-A, MW-B and MW-18 and absorbent socks were installed at MW-6 and VEW-1 to recover LPH. Performed monthly LPH recovery at MW-A, MW-B, MW-6 and MW-18. NO LPH were detected at VEW-1. DTW 24.86 (MW-12) to 33.67 (MW-7). Flows to southwest. MW-9, 20,560 BTEX, 59,000 MTBE. email to BP/GES to approve the proposed delineation. A work plan or investigation report shall be expected. In the mean time, product removal shall be continue. 5/10/2013 - Reviewed Proposed Boring Location map, dated 5/2/2013. GES proposed 5 soil borings, 2 soil borings/monitoring wells, 1 step-off soil boring. Locations are fine. Reviewed the Generic Site Investigation Work Plan. Same comments as previously review. 1) "clean" sample for vertical delineation; 2) site specific drilling depth; 3) investigation derived waste issue. Email to BP/GES approving the delineation work and comments on the Generic Work Plan.12/4/2014 - Reviewed Remedial Action Plan, dated 11/14/2014, by GES. GES proposed to install SVE/AS system. SVE wells screen 15-30 feet. AS wells screen 35-38 feet. SVE ROI 22 feet. AS ROI 15 feet. Email comments to GES "1) The RAP mentioned about upwelling which caused by AS/SVE application for about 5 feet, some up to 7 feet in the feasibility study. Is it because of the site lithology? And do you need to adjust vacuum/pressure to be applied to reduce some of the upwelling? 2) AS wells screen to 35-38 feet. Water table at 28-32 feet. The screen depth shall be fine if you are targeting the petroleum impacted water. But the RAP also mentioned the adsorbed-phase hydrocarbon contamination are at 22-38 feet. Are you also targeting the contamination at 38 feet? If so, the AS wells shall screen deeper than 38 feet as the AS bubble would not go laterally, but only vertically.3) For air emission requirement, you have to meet the STIP and the 2003 Memo based on Central Office guidance. I have attached the 2003 Memo."12/16/2014 - Email from GES on 12/10/2014 and 12/12/2014 responding to DEC comments. Approved RAWP calls for the installation and operation of SVE/AS system. Letter to BP/GES.

Remarks: UNICO WAS DOING A TANK EXCAVATION OF (14) 550'S, CONTAMINATED SOIL WASDISCOVERED UNDER TANKS.SPILL REASSIGNED FROM SIGONA TO ROMMEL.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 12/16/2014
Date Data Arrived at EDR: 01/08/2015
Date Made Active in Reports: 02/09/2015
Number of Days to Update: 32

Proposed NPL: Proposed National Priority List Sites
A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 12/16/2014

NPL LIENS: Federal Superfund Liens
Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 10/25/2013
Date Data Arrived at EDR: 11/11/2013

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RES DECL: Restrictive Declarations Listing
A restrictive declaration is a covenant running with the land which binds the present and future owners of the property. As a condition of certain special permits, the City Planning Commission may require an applicant to sign and record a restrictive declaration that places specified conditions on the future use and development of the property. Certain restrictive declarations are indicated by a D on zoning maps.

VCP: Voluntary Cleanup Agreements

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

State and tribal Brownfields sites

ERP: Environmental Restoration Program Listing

In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

SSTS: Section 7 Tracking Systems
Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

E DESIGNATION: E DESIGNATION SITE LISTING
The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List
The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)
The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR US Hist Auto Stat: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR US Hist Cleaners: EDR Exclusive Historic Dry Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

EXECUTIVE SUMMARY

This investigation was completed to address issues presented in a Phase I Environmental Site Assessment (ESA) conducted by G.C. Environmental, Inc. (GCE) issued February 4, 2004, and on the limited soil gas survey issued by Fleming Lee Shue on March 2004. A sampling and analysis program was designed to determine if prior and/or present uses on the subject property have impacted the subsurface soils and environment as outlined in our Scope of Work dated April 26, 2004. The sampling and analysis plan consisted of soil quality testing using analytical test methods consistent with expected parameters and agency soil cleanup guidelines. The following presents an evaluation of our investigation.

EEA conducted the Phase II Environmental Site Assessment based on the finding of the previous Phase I ESA. These findings indicated that the western portion of the site was a gasoline station from circa 1923 to circa 1955. In addition, regulatory records indicated that a permit was issued for a portion of the property for ten (10) buried gasoline tanks and also indicated that there were four (4) gasoline pumps located on the northwestern portion of the site. In addition, the 1932 and the 1951 Sanborn Fire Insurance maps showed three (3) gasoline tanks located on the northwestern portion of the site and labeled it as a "filling station". Based on the information from the previous Phase I, the following tasks were completed during EEA's Phase II Subsurface Investigation:

Geophysical Survey – Magnetometer

During field activities, EEA performed a magnetometer survey over the property to determine if any underground storage tanks (USTs) were present on the property using a Fisher TW-6 magnetometer. The survey was conducted in the arESA of the suspected USTs around the former gasoline service station and auto repair facility. The survey did not indicate that there were any USTs present in the subsurface.

EEA concludes that the tanks had been removed at an earlier time and does not recommend any further action.

Former Gasoline Service Station

At the location of the former gasoline service station, six (6) soil borings were advanced to depth. Of these six soil borings, five (5) soil samples were selected for laboratory analysis based on field observations and field screening via a portable Organic Vapor Analyzer (OVA). Soil samples were analyzed for volatile organic compounds (VOCs) via USEPA Method 8021,

semi-volatile organic compounds (SVOCs) via USEPA Method 8270 and total petroleum hydrocarbons (TPH) via USEPA Method 8015. Results of soil analysis indicated that soil boring B-1 had some low-level concentrations of SVOCS above the New York State Department of Environmental Conservation (NYSDEC) Technical and Administrative Guidance Memorandum (TAGM) criteria. All five soil samples also had detections for TPH, however the concentrations were well below any regulatory guidelines. EEA concludes that the former gasoline station had not significantly impacted soil at the property.

Based on the analytical results, EEA does not recommend any further action in regards to the former gasoline station.

There are no recommendations for additional site investigation or remedial corrective action for this property at this time based upon the information disclosed in our investigation.

I. INTRODUCTION

This investigation was completed to address issues addressed in our Scope of Work dated April 26, 2004. A sampling and analysis program was designed to determine if prior and/or present uses on the subject property have impacted the subsurface soils and environment. The sampling and analysis plan consisted of soil quality testing using analytical test methods consistent with expected parameters and agency soil cleanup guidelines. The following presents an evaluation of our investigation.

EEA conducted the Phase II Environmental Site Assessment based on the finding of the previous Phase I ESA. These findings indicated that the western portion of the site was a gasoline station from circa 1923 to circa 1955. In addition, regulatory records indicated that a permit was issued for a portion of the property for ten (10) buried gasoline tanks and also indicated that there were four (4) gasoline pumps located on the northwestern portion of the site. In addition, the 1932 and the 1951 Sanborn Fire Insurance maps showed three (3) gasoline tanks located on the northwestern portion of the site and labeled it as a "filling station". Based on the information from the previous Phase I, EEA's initiated the Phase II Subsurface Investigation:

EEA initiated field activities on May 10, 2004; all Phase II field activities were completed by that date. This report summarizes the work performed, the results of the investigation, and the recommended remedial action requirements (if any).

II. SCOPE OF WORK PERFORMED

a. Health and Safety Plan

EEA uses a company Generic Health and Safety Plan for all investigative work relating to performing Phase II Environmental Subsurface Investigations. The HASP assigns responsibilities, establishes personal protection standards, recommends operating procedures, and provides for contingencies that may arise during performance of the assessment at the site. The protocols in the HASP apply to all personnel involved in the work activities including EEA, all outside subcontractors, client, or regulatory agencies present during the performance of the work. In addition, the following safety equipment is maintained on-site for responding to potential emergency situations: portable eyewash, ABC fire extinguisher, and first aid kit. Telephone numbers of emergency response units in the area are also posted where all those working at the site can ESAily see them. All personnel working at the site will also be required to receive training in respirator fitting, emergency procedures, equipment decontamination, and specific task procedures. All personnel involved with the collection of soil or water will have successfully completed the 40-hour OSHA Hazardous Materials Training Program.

b. Subsurface Utility Location, Permits and Bonding

EEA notified the New York City/Long Island One Call Center under the New York State Regulation Code 753 prior to initiating the work to identify the location of underground utilities in the vicinity of the proposed boring locations. The confirmation number assigned to the site was #1240288. Any permits for soil boring were obtained from the local agencies. In addition, any license and permit bonding required was secured for the work.

c. Investigation Work Summary

All soil sampling was completed using a Geoprobe Model 54LT using the *Macrocore* soil sampling system. Samples were field screened for volatile organic vapors using an organic vapor meter (OVM). If no reading was found, then the bottom sample or the sample determined to be the most representative was selected for laboratory testing. The geophysical survey was conducted utilizing a Fisher TW-6 magnetometer.

- A geophysical survey (magnetometer) to investigate USTs
- Six (6) soil borings (B-1,B-2, B-3, B-4, B-5 and B-6) to investigate the location of the former gasoline station on-site.

d. Geophysical Survey - Magnetometer

EEA performed a magnetometer survey over the property to determine if any USTs were present on the property. The survey was performed with a Fisher TW-6 magnetometer in the areas of the suspected underground tanks (around the former gasoline station and auto repair facility). The survey did not indicate that there were any USTs present in the subsurface. EEA concludes that these USTs had been removed at an earlier time.

e. Former Gasoline Service Station

Six (6) soil borings were completed in order to investigate the area of the former gasoline service station. The soil borings were completed to a depth of 12 feet using a Geoprobe Model 54LT and *Macrocore* soil sampling system. Each sample was field screened for volatile organic vapors using an OVM. Based on field observations and OVM readings, five (5) soil boring samples were submitted for laboratory analysis. Samples were selected based upon the results of the OVM field screening. The sample with the highest OVM reading was selected for testing. If no reading was found, then the bottom sample or the sample determined to be the most representative was selected for laboratory testing Each sample sent to the laboratory was tested for volatile organic compounds (VOCs via US EPA Method 8021), semi-volatile organic compounds (SVOCs via US EPA Method 8270) and TPH (via US EPA Method 8015). Soil sample B-1 had some low-level concentrations of SVOCs (Benzo (a) Anthracene and Benzo (a) Pyrene) slightly above the NYSDEC TAGM criteria. Also, all five soil samples had detections for TPH, however the concentrations are well below any regulatory guidelines. Based on the

minor detections for SVOCs and TPH, EEA concludes that the former gasoline service station has not impacted subsurface soils on the property.

III. RESULTS OF LABORATORY ANALYSES

Ecotest Laboratories, Inc. (NYSDOH Certification #10320) prepared the results of the soil samples. Tables 1 and 2 present a summary of the results and a comparison to New York State Department of Environmental Conservation (NYSDEC) STARS Memo #1 and Technical and Administrative Guidance Manual (TAGM) cleanup guidelines. The chain-of-custody records, as well as the analytical laboratory data sheets, are presented in the Appendix to this report.

The soil sample collection locations are presented in Figure 1. The soil boring report logs present the field observations made at each soil boring location and site photographs are presented in the Appendix to this report.

IV. FINDINGS AND CONCLUSIONS

a. Geophysical Survey - Magnetometer

The magnetometer survey did not indicate that USTs were still present in the vicinity of the former gasoline service station and auto repair facility. EEA concludes that these tanks had been removed at an earlier time.

b. Former Gasoline Service Station

Six (6) soil borings were advanced in the area of the former gasoline service station, and of these, five (5) soil samples were submitted for laboratory analysis. Analytical results indicate that soil boring B-1 had some low-level concentrations of SVOCS above the NYSDEC TAGM criteria. Also, all five soil samples had detections for TPH, however the concentration were well below any regulatory guidelines. EEA concludes that the former USTs had been removed and that the former USTs have not significantly impacted subsurface conditions at the subject property.

The NYSDEC has developed the "guidelines" in order for DEC case managers to determine potential cleanup recommendations at various sites thoughout the state. The New York City Department of Environmental Protection (NYCDEP) and USEPA have developed similar guidelines. The NYSDEC and NYCDEP consider each site on a case-by-case basis in consideration of the property usage and its location to sensitive human, wildlife and environmental interests. Industrial properties are treated differently than residential or environmentally sensitive areas. In order to determine the specific requirements regarding potential remedial corrective action, EEA recommends that this report is reviewed by the applicable regulating agency.

Figure 1: Site Location Plan
64-06 Queens Boulevard
Woodside, New York

Job No.: 04716

Drawn By: FI

Date: 5/28/04

V. RECOMMENDATIONS

There are no recommendations for additional site investigation or remedial corrective action for this property at this time based upon the information disclosed in our investigation.

VI. SAMPLING METHODOLOGY

a. Soil Sampling

Soil samples were obtained by utilizing a Geoprobe Model 54 LT utilizing the *Macrocore* soil sampling system. An organic vapor analysis was performed on all soil samples using a Thermo Environmental Instruments Inc. 580B photo-ionization detector (OVM). Generally, the sample producing the highest organic vapor reading was sent to the laboratory for analysis. If no reading was found, the sample was selected based upon visual analysis to be best representative of the location.

Soils at the site consisted of brown, fine to medium grained sand intermixed with gravel, stones and brick where fill material was encountered and brown, fine to medium grained sand and some silt where native material was encountered. Soil borings were advanced to a depth of 12 feet below grade and ground water was not encountered on-site.

b. Quality Assurance and Quality Control QA/QC Plan

EBA implements a QA/QC Plan to ensure sample integrity and avoid contamination and/or cross-contamination of samples. All sampling equipment is cleaned before each sample is collected. When petroleum hydrocarbon contamination is encountered, all equipment is steam-cleaned. The following procedures are followed in the decontamination process:

Step 1: Steam clean equipment.
Step 2: Scrub with a bristle brush using a non-phosphate detergent (such as Alconox).
Step 3: Rinse with hot tap water.
Step 4: Rinse twice with deionized water.
Step 5: Air dry.
Step 6 Nitric Acid (5%) solution rinse (if sampling for metals)
Step 7: Rinse twice with deionized water.
Step 8: Air dry.

VII QUALIFICATIONS

EBA, Inc. is an environmental consulting firm that has undertaken environmental pollution investigations, development feasibility studies, and environmental site assessment

studies since 1979. These site evaluation studies have been prepared for major lenders, public corporations, businesses, developers and governmental agencies. Approximately 4,000 parcels have been evaluated in the metropolitan New York-New Jersey area during the past twenty years, ranging from Phase I Environmental Site Assessments to comprehensive subsurface hazardous material investigations and testing programs. EEA also prepares bid specifications for remedial cleanup actions and supervises site cleanup.

EEA's principals and senior managers for the hazardous waste investigations each have over 20 years experience in environmental consulting, with established credentials in the field.

Individual qualifications of EEA personnel, including specific credentials of persons involved in the preparation of this report can be provided upon request.

VIII. DISCLAIMER

This report is for use by Mr. Simon Rothkrug of the Rothkrug, Rothkrug, Weinburg & Spector, and is only to be used as a guide in determining the potential for contamination by toxic or hazardous materials on the subject property at the time of the site visit. This Phase II Environmental Subsurface Investigation was undertaken in accordance with generally accepted protocols, including ASTM Standards Related to the Phase II Environmental Site Assessment Process. This Phase II Investigation is based principally on the review of historic and regulatory records (made available within a reasonable time period), relating to past occupants and usage of the subject property, as well as activities at nearby sites, and upon a visual assessment of the subject property, and makes no determinations with respect to portions of the subject property and its structures which were not inspected. Our professional services have been performed using that degree of care and skill ordinarily exercised under similar circumstances by reputable qualified professionals practicing in this or similar situations. The interpretation of the field data is based on good judgement and experience. However, no matter how qualified the professional or detailed the investigation, subsurface conditions cannot always be predicted beyond the points of actual sampling and testing. No other warranty, expressed or implied, is made to the professional advice included in this report.

Any and all liability on the part of EEA, Inc. shall be limited solely to EEA's professional liability insurance (errors and omissions coverage of one million dollars). EEA, Inc. shall have no liability for any other damages, whether consequential, compensatory, punitive, or special, arising out of, incidental to, or as a result of, this assessment. EEA, Inc. assumes no liability for the use of this report by any person or entity other than the institution and/or entities or persons for whom it has been prepared.

1.0 INTRODUCTION AND SCOPE OF INVESTIGATION

A Phase II Subsurface Investigation was performed by Advanced Cleanup Technologies, Inc. (ACT) from August 14th through August 15th, 2014 at the property located at 64-02/06 Queens Boulevard, Woodside, New York ("the site"). The purpose for the subsurface investigation was to determine any impacts associated with the historical usage of the subject property as a gasoline filling station. The site is also listed with a Hazardous Materials designation E-138 specifically for Underground Gasoline Storage Tanks (USTs) – Testing Protocol, Window Wall Attenuation and Alternate Ventilation and lastly Air Quality – HVAC fuel limited to natural gas.

The scope of work included the performance of a geophysical survey to determine the existence of suspect underground gasoline and fuel oil tanks. The scope of work also included the collection of soil samples from three soil borings, and the sampling of three-soil vapor probes. Finally, the scope of work included the laboratory analysis of six soil samples and two soil vapor samples by a New York State Department of Health (NYSDOH) certified laboratory in accordance with protocols established by the United States Environmental Protection Agency (USEPA).

Soil quality data was compared to New York State Department of Environmental Conservation (NYSDEC) soil cleanup objectives contained in NYSDEC Part 375-6.8(a) Unrestricted Used Soil Cleanup Objectives, appropriate Part 375-6.8(b) Restricted Soil Cleanup Objectives. Soil vapor was data was compared to Table 3.1 of the NYSDOH "Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York", October 2006.

2.0 SITE DESCRIPTION

2.1 Site Location

The site is located on the south side of Queens Boulevard at the intersection with 64th Street in a commercial and residential area in the western portion of the borough of Brooklyn, New York. The site is bounded by 64th Street followed by an eight story commercial and residential apartment building to the west, a three story commercial property to the east, Queens Boulevard followed by a two story Motor Inn to the North two story residential homes to the south.

The nearest surface water body, the Maspeth Creek, is located approximately 2 miles to the southwest and regional groundwater is expected to flow to the southwest towards the Maspeth Creek.

2.2 General Description

The site (Block 2325, Lots 26, 30 and 32) consists of a one story commercial building and a parking lot. The most recent use of the property is for an auto parts retail store (Auto Barn). The site is approximately 16,562 square feet in area and the building has a footprint of approximately 10,926 square feet. A diagram of site features is included as Figure 1.

2.3 Previous Environmental Reports

A Subsurface Investigation Report dated May 28th, 2004, was prepared by EEA Inc. The purpose of the report was to address issues presented in a Phase I Environmental Site Assessment (Phase I) by G.C. Environmental, Inc. in February 2004 and a limited soil gas survey by Fleming Lee Shue in March 2004. The scope of work included the use of a magnetometer for the location of possible USTs, the installation of 6 soil borings and the analysis of five soil samples. The report concluded the following:

- Soil along the northeast portion of the parking lot contained low-level concentrations of semi-volatile organic compounds above regulatory criteria.

- All of the soil samples contained detections of [Total Petroleum Hydrocarbons] below regulatory criteria.

EEA Inc. recommended that the subsurface investigation be presented to the applicable regulatory agency.

A Phase I Environmental Site Assessment report was prepared by Merritt Environmental Consulting Corp. (Merritt) dated October 24th, 2013. The Phase I report identified the following pertinent recognized environmental conditions:

- Historical usage of the property as a gasoline filling station. Historical sources showed three gasoline storage tanks present at the property from 1932-1951;
- Hazardous Materials E-Designation for the subject property E-163 specifically for Underground Gasoline Storage Tanks (USTs) – Testing Protocol, Window Wall Attenuation and Alternate Ventilation and lastly Air Quality – HVAC fuel limited to natural gas.

Available copies of the above-referenced reports are included as Appendix A.

3.0 FINDINGS OF THE INVESTIGATION

3.1 Geophysical Investigation

A geophysical survey was performed on June 30th, 2014 and encompassed all accessible portions of the parking lot. The survey was performed to determine the existence and locations of suspected USTs at the site. The survey notes are included in Appendix B.

The survey was performed utilizing an SIR-2000 GPR Unit and a 500 megahertz transducer, which allowed for the identification of anomalies to a depth of 10 feet bgs. The transducer was pulled along pre-determined transects, emitting radar into the subsurface. The radar signal reflects off stratigraphical materials and foreign objects in the subsurface and back to the transducer based upon differences in the conductivity and dielectric constant of subsurface features. The radar signal is then converted into an electrical signal, which is visually displayed on a video monitor.

No anomalies were identified large enough to be indicative of USTs. Anomalies that were identified were indicative of conduit piping and minor debris at various locations beneath the fairly uniform asphalt parking lot.

GPR is primarily used as a preliminary survey of a property for the development of subsurface information prior to a formal site assessment. Surface cover or obstructions, subsurface soil types and buried debris can mask or conceal the presence and precise locations of underground structures or even suggest their presence when none exist. The presence, absence or precise locations of underground structures indicated during a GPR survey should be confirmed by excavation, subsurface sampling or other invasive procedures.

3.2 Soil Boring Installation

Three soil borings were installed at the locations indicated in Figure 2. The soil borings were installed utilizing a truck-mounted Geoprobe-style drill unit in combination with 5-foot macro-core soil samplers containing dedicated acetate liners. Soil samples were visually examined for lithology and the presence of contamination and field screened utilizing a Photovac 2020 hand held photoionization detector (PID). The PID is capable of detecting organic vapors at concentrations as low as 0.1 parts per million (ppm). All down hole drilling equipment was decontaminated between sampling events to minimize the possibility of cross-contamination. Copies of the boring logs are included in Appendix B.

The soil boring located at SB-1 was installed to a depth of 15 feet bgs in the southern portion of the site in the parking lot. The soil generally consisted of light brown silty sand mixed with pebbles and clay. The water table was not encountered. PID readings were 0.0ppm throughout the boring with a reading of 1.5ppm at 3.5'. A large rock got lodged in the samples at 15'bgs and no sample was collected from the bottom. Soil samples were collected from 3-5' bgs where a slight PID reading was recorded.

Soil boring, SB-2 was installed to a depth of 15 feet bgs in the eastern portion of the parking lot. The soil generally consisted of light brown silty sand mixed with pebbles and clay. The water table was not encountered. PID readings were 0.0 ppm throughout the boring. Soil samples were collected from 3-5' bgs beneath the asphalt and fill layer and 12 to 14 feet bgs.

SB-3 was installed to a depth of 20 feet bgs in the northwestern corner of the parking lot. The soil generally consisted of light brown medium sand mixed with silt and pebbles. The water table was not encountered. PID readings were 0.0 ppm throughout the boring. The sample from 15-20' bgs became lodged in the sampler and recovery efforts compromised the characterization. A composite sample was collected from that depth. Soil samples were collected from 0-4' bgs, 5-8' bgs and 15 to 12 feet bgs.

All soil samples were containerized and placed in a cooler for laboratory analysis and transmitted under chain of custody to York Analytical Laboratories (NYSDOH # 10854). Soil samples were analyzed for VOCs in accordance with USEPA Method 8260, SVOCs in accordance with EPA Method 8270, TAL Metals in accordance with USEPA Method 6000/7000 and PCB's/Pesticides in accordance with USEPA Methods 8081/8082. Copies of the laboratory reports are contained as Appendix C.

3.3 Sub-Slab Soil Vapor Sampling

Two sub-slab soil vapor probes were installed through the asphalt parking lot at the locations indicated in Figure 2. A six-inch woven stainless steel soil vapor implant was installed to a depth of 5 feet bgs in SV-1 and SV-2. The implants were fitted with ¼ inch inner diameter polyethylene tubing. The annulus around the implant was backfilled with glass beads. A three-foot layer of bentonite slurry was placed above the implant to prevent ambient air infiltration. The remainder of the borehole was backfilled with native soil and a bentonite grout seal installed at the ground surface. All drilling equipment was decontaminated between locations to minimize the possibility of cross-contamination.

The portion of polyethylene tube emerging from the ground was connected to a low flow vacuum pump that purged the probe of soil vapor at a rate that did not exceed 0.2 liters per minute. A 6-Liter stainless steel Summa canister with a flow regulator set to a flow rate of approximately 0.025 liters per minute was connected to the polyethylene tubing and collected soil vapor approximately 4 to 6 hours until the canisters were full.

All air samples were collected utilizing 6-Liter stainless steel Summa canisters connected to

low-flow regulators, which were numbered and supplied by York Analytical Laboratories. The regulators were set to a flow rate of approximately 0.025 liters per minute for a 4-6 hour sample. Field notes are provided in Appendix A.

Two air samples were transmitted under chain of custody to York Analytical Laboratories. All samples were analyzed volatile organic compounds (VOCs) in accordance with EPA TO-15. Methodologies used for soil vapor assessment conform to the *NYS DOH Final Guidance on Soil Vapor Intrusion, October 2006.* Copies of the laboratory reports are contained as Appendix B.

3.4 Soil Quality

The analytical results for the soil samples SB-1 (3-5), SB-2 (3-5), SB-2 (12-14), SB-3 (0-4), SB-3 (5-8) and SB-3 (15-20) are summarized in Tables 1 through 4. The soil quality data was compared to unrestricted, restricted residential and commercial use soil cleanup objectives (UUSCOs, RRSCOs and CSCOs) contained in Table 6.8 of 6 NYCRR Part 375.

It can be seen from Table 1 that no VOCs were detected above soil cleanup objectives in SB-1 (3-5), SB-2 (3-5), SB-2 (12-14), SB-3 (15-18) and SB-4 (14-16)). Acetone was the only VOC detected above UUSCO's in SB-3 (0-4) and SB-3 (5-8) and is commonly utilized as a laboratory solvent and a possible artifact from laboratory equipment. SB-3 (0-4) and SB-3 (5-8) contained low-level concentrations of Tetrachloroethene (PCE) below regulatory standards. TCE is a common solvent most commonly utilized in dry cleaning activities.

Table 2 indicates that no SVOCs were detected above soil cleanup objectives. Table 3 summarizes the extent of PCB and Pesticides in the soil beneath the site. No PCBs or Pesticides were detected above method detection limits in any of the samples.

Concentrations of TAL metals in soil beneath the site are summarized in Table 4. A total of 5 metals were detected above cleanup objectives. Copper was detected above UUSCO in SB-2 (3-5) and SB-3 (0-4) with a maximum concentration of 85.7 µg/kg. Lead was detected above its UUSCO in SB-2 (3-5) and SB-3 (0-4) with a maximum concentration of 239 µg/kg. Nickel (32.7 µg/kg) and

Cadmium (3.76 µg/kg) were detected above their respective UUSCOs in SB-2 (3-5). Zinc was found to exceed its UUSCO in SB-2 (3-5) and SB-3 (0-4) with the highest concentration of 1,890 µg/kg. Metals are commonly found at higher concentrations in urban areas due to the presence of fill materials. All of the highest concentrations of metals were detected at the shallow sampling interval, indicating that ground water is unlikely the source of the contamination.

Based on the sampling results described above, the majority of the metal contamination is restricted to shallow soils in middle to northern side of the parking lot. All compounds were detected below their respective restricted residential soil cleanup objectives.

3.5 Sub-Slab Soil Vapor Results

The analytical results for the sub-slab soil vapor samples SV-1 and SV-2 are summarized in Table 5. The soil vapor data collected during this investigation was compared to guidance values in NYSDOH's "Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York" (NYSDOH, 2006).

As shown in Table 5, the soil vapor samples contained levels of both chlorinated and non-chlorinated compounds all below their respective guidance values. The NYSDOH has guidelines for three compounds including Trichloroethene (TCE), Tetrachloroethene (PCE) and Methylene chloride. TCE was detected in SV-2 above its guideline of 5 $\mu g/m^3$ with a concentration of 12 $\mu g/m^3$. PCE was detected in both samples in exceedence of the guideline of 30 $\mu g/m^3$; SV-2 contained the maximum concentration of 460 $\mu g/m^3$. Methylene chloride was detected above its guideline of 60 $\mu g/m^3$ in SV-2 with a concentration of 67 $\mu g/m^3$. TCE, PCE and Methylene chloride are classified as solvents and are commonly found in industrial and urban areas. The most prevalent compound detected in soil vapor was Acetone a common laboratory solvent and a possible artifact from laboratory equipment. Low levels of petroleum compounds were detected in soil vapor and would be consistent with the historic use of the site for a gasoline filling station as well as an auto parts store.

4.0 CONCLUSIONS

The results of this subsurface investigation are contained in this report. Based upon this investigation, ACT makes the following conclusions concerning the soil and groundwater quality beneath the site.

- The GPR survey did not identify the presence of any USTs beneath the site;
- No VOCs except low concentrations of acetone were detected above soil cleanup objectives in the soil beneath the site and acetone appears to be a laboratory artifact;
- Shallow soils beneath the northern section of the parking lot are contaminated with metals above unrestricted use soil cleanup objectives, which could be indicative of historical fill materials commonly found in the area of the site;
- Elevated concentrations of solvents such as TCE, PCE and Methylene chloride in soil vapor should be investigated further and remediated during future development at the property. This can be accomplished through the installation of a vapor barrier and a sub-slab depressurization system;
- The E-designations assigned to the property should be satisfied with the New York City Office of Environmental Remediation (OER) prior to property development. This report should be provided to them for review and comments.
- No significant soil contamination was found beneath the site and the contamination present does not pose a threat to the surrounding area.

EXCLUSIONS AND DISCLAIMER

The purpose of this investigation was to assess the potential environmental liabilities at the subject site with respect to data, which Advanced Cleanup Technologies, Inc. has accumulated during the Phase II Environmental Site Assessment. The conclusions presented in this report are based solely on the observations of the site at the time of the investigation. Data provided, including information provided by others, was utilized in assessing the site conditions. The accuracy of this report is subject to the accuracy of the information provided. Advanced Cleanup Technologies, Inc. is not responsible for areas not seen or information not collected. This report is given without a warranty or guarantee of any kind, expressed or implied. Advanced Cleanup Technologies, Inc. assumes no responsibility for losses associated with the use of this report.

EXECUTIVE SUMMARY

This investigation was completed to address issues presented in a Phase I Environmental Site Assessment (ESA) conducted by G.C. Environmental, Inc. (GCE) issued February 4, 2004, and on the limited soil gas survey issued by Fleming Lee Shue on March 2004. A sampling and analysis program was designed to determine if prior and/or present uses on the subject property have impacted the subsurface soils and environment as outlined in our Scope of Work dated April 26, 2004. The sampling and analysis plan consisted of soil quality testing using analytical test methods consistent with expected parameters and agency soil cleanup guidelines. The following presents an evaluation of our investigation.

EEA conducted the Phase II Environmental Site Assessment based on the finding of the previous Phase I ESA. These findings indicated that the western portion of the site was a gasoline station from circa 1923 to circa 1955. In addition, regulatory records indicated that a permit was issued for a portion of the property for ten (10) buried gasoline tanks and also indicated that there were four (4) gasoline pumps located on the northwestern portion of the site. In addition, the 1932 and the 1951 Sanborn Fire Insurance maps showed three (3) gasoline tanks located on the northwestern portion of the site and labeled it as a "filling station". Based on the information from the previous Phase I, the following tasks were completed during EEA's Phase II Subsurface Investigation:

Geophysical Survey – Magnetometer

During field activities, EEA performed a magnetometer survey over the property to determine if any underground storage tanks (USTs) were present on the property using a Fisher TW-6 magnetometer. The survey was conducted in the arESA of the suspected USTs around the former gasoline service station and auto repair facility. The survey did not indicate that there were any USTs present in the subsurface.

EEA concludes that the tanks had been removed at an earlier time and does not recommend any further action.

Former Gasoline Service Station

At the location of the former gasoline service station, six (6) soil borings were advanced to depth. Of these six soil borings, five (5) soil samples were selected for laboratory analysis based on field observations and field screening via a portable Organic Vapor Analyzer (OVA). Soil samples were analyzed for volatile organic compounds (VOCs) via USEPA Method 8021,

semi-volatile organic compounds (SVOCs) via USEPA Method 8270 and total petroleum hydrocarbons (TPH) via USEPA Method 8015. Results of soil analysis indicated that soil boring B-1 had some low-level concentrations of SVOCS above the New York State Department of Environmental Conservation (NYSDEC) Technical and Administrative Guidance Memorandum (TAGM) criteria. All five soil samples also had detections for TPH, however the concentrations were well below any regulatory guidelines. EEA concludes that the former gasoline station had not significantly impacted soil at the property.

Based on the analytical results, EEA does not recommend any further action in regards to the former gasoline station.

There are no recommendations for additional site investigation or remedial corrective action for this property at this time based upon the information disclosed in our investigation.

I. INTRODUCTION

This investigation was completed to address issues addressed in our Scope of Work dated April 26, 2004. A sampling and analysis program was designed to determine if prior and/or present uses on the subject property have impacted the subsurface soils and environment. The sampling and analysis plan consisted of soil quality testing using analytical test methods consistent with expected parameters and agency soil cleanup guidelines. The following presents an evaluation of our investigation.

EEA conducted the Phase II Environmental Site Assessment based on the finding of the previous Phase I ESA. These findings indicated that the western portion of the site was a gasoline station from circa 1923 to circa 1955. In addition, regulatory records indicated that a permit was issued for a portion of the property for ten (10) buried gasoline tanks and also indicated that there were four (4) gasoline pumps located on the northwestern portion of the site. In addition, the 1932 and the 1951 Sanborn Fire Insurance maps showed three (3) gasoline tanks located on the northwestern portion of the site and labeled it as a "filling station". Based on the information from the previous Phase I, EEA's initiated the Phase II Subsurface Investigation:

EEA initiated field activities on May 10, 2004; all Phase II field activities were completed by that date. This report summarizes the work performed, the results of the investigation, and the recommended remedial action requirements (if any).

II. SCOPE OF WORK PERFORMED

a. Health and Safety Plan

EEA uses a company Generic Health and Safety Plan for all investigative work relating to performing Phase II Environmental Subsurface Investigations. The HASP assigns responsibilities, establishes personal protection standards, recommends operating procedures, and provides for contingencies that may arise during performance of the assessment at the site. The protocols in the HASP apply to all personnel involved in the work activities including EEA, all outside subcontractors, client, or regulatory agencies present during the performance of the work. In addition, the following safety equipment is maintained on-site for responding to potential emergency situations: portable eyewash, ABC fire extinguisher, and first aid kit. Telephone numbers of emergency response units in the area are also posted where all those working at the site can ESAily see them. All personnel working at the site will also be required to receive training in respirator fitting, emergency procedures, equipment decontamination, and specific task procedures. All personnel involved with the collection of soil or water will have successfully completed the 40-hour OSHA Hazardous Materials Training Program.

b. Subsurface Utility Location, Permits and Bonding

EEA notified the New York City/Long Island One Call Center under the New York State Regulation Code 753 prior to initiating the work to identify the location of underground utilities in the vicinity of the proposed boring locations. The confirmation number assigned to the site was #1240288. Any permits for soil boring were obtained from the local agencies. In addition, any license and permit bonding required was secured for the work.

c. Investigation Work Summary

All soil sampling was completed using a Geoprobe Model 54LT using the *Macrocore* soil sampling system. Samples were field screened for volatile organic vapors using an organic vapor meter (OVM). If no reading was found, then the bottom sample or the sample determined to be the most representative was selected for laboratory testing. The geophysical survey was conducted utilizing a Fisher TW-6 magnetometer.

- A geophysical survey (magnetometer) to investigate USTs
- Six (6) soil borings (B-1,B-2, B-3, B-4, B-5 and B-6) to investigate the location of the former gasoline station on-site.

d. Geophysical Survey - Magnetometer

EEA performed a magnetometer survey over the property to determine if any USTs were present on the property. The survey was performed with a Fisher TW-6 magnetometer in the areas of the suspected underground tanks (around the former gasoline station and auto repair facility). The survey did not indicate that there were any USTs present in the subsurface. EEA concludes that these USTs had been removed at an earlier time.

e. Former Gasoline Service Station

Six (6) soil borings were completed in order to investigate the area of the former gasoline service station. The soil borings were completed to a depth of 12 feet using a Geoprobe Model 54LT and *Macrocore* soil sampling system. Each sample was field screened for volatile organic vapors using an OVM. Based on field observations and OVM readings, five (5) soil boring samples were submitted for laboratory analysis. Samples were selected based upon the results of the OVM field screening. The sample with the highest OVM reading was selected for testing. If no reading was found, then the bottom sample or the sample determined to be the most representative was selected for laboratory testing Each sample sent to the laboratory was tested for volatile organic compounds (VOCs via US EPA Method 8021), semi-volatile organic compounds (SVOCs via US EPA Method 8270) and TPH (via US EPA Method 8015). Soil sample B-1 had some low-level concentrations of SVOCs (Benzo (a) Anthracene and Benzo (a) Pyrene) slightly above the NYSDEC TAGM criteria. Also, all five soil samples had detections for TPH, however the concentrations are well below any regulatory guidelines. Based on the

minor detections for SVOCs and TPH, EEA concludes that the former gasoline service station has not impacted subsurface soils on the property.

III. RESULTS OF LABORATORY ANALYSES

Ecotest Laboratories, Inc. (NYSDOH Certification #10320) prepared the results of the soil samples. Tables 1 and 2 present a summary of the results and a comparison to New York State Department of Environmental Conservation (NYSDEC) STARS Memo #1 and Technical and Administrative Guidance Manual (TAGM) cleanup guidelines. The chain-of-custody records, as well as the analytical laboratory data sheets, are presented in the Appendix to this report.

The soil sample collection locations are presented in Figure 1. The soil boring report logs present the field observations made at each soil boring location and site photographs are presented in the Appendix to this report.

IV. FINDINGS AND CONCLUSIONS

a. Geophysical Survey - Magnetometer

The magnetometer survey did not indicate that USTs were still present in the vicinity of the former gasoline service station and auto repair facility. EEA concludes that these tanks had been removed at an earlier time.

b. Former Gasoline Service Station

Six (6) soil borings were advanced in the area of the former gasoline service station, and of these, five (5) soil samples were submitted for laboratory analysis. Analytical results indicate that soil boring B-1 had some low-level concentrations of SVOCS above the NYSDEC TAGM criteria. Also, all five soil samples had detections for TPH, however the concentration were well below any regulatory guidelines. EEA concludes that the former USTs had been removed and that the former USTs have not significantly impacted subsurface conditions at the subject property.

The NYSDEC has developed the "guidelines" in order for DEC case managers to determine potential cleanup recommendations at various sites thoughout the state. The New York City Department of Environmental Protection (NYCDEP) and USEPA have developed similar guidelines. The NYSDEC and NYCDEP consider each site on a case-by-case basis in consideration of the property usage and its location to sensitive human, wildlife and environmental interests. Industrial properties are treated differently than residential or environmentally sensitive areas. In order to determine the specific requirements regarding potential remedial corrective action, EEA recommends that this report is reviewed by the applicable regulating agency.

V. RECOMMENDATIONS

There are no recommendations for additional site investigation or remedial corrective action for this property at this time based upon the information disclosed in our investigation.

VI. SAMPLING METHODOLOGY

a. Soil Sampling

Soil samples were obtained by utilizing a Geoprobe Model 54 LT utilizing the *Macrocore* soil sampling system. An organic vapor analysis was performed on all soil samples using a Thermo Environmental Instruments Inc. 580B photo-ionization detector (OVM). Generally, the sample producing the highest organic vapor reading was sent to the laboratory for analysis. If no reading was found, the sample was selected based upon visual analysis to be best representative of the location.

Soils at the site consisted of brown, fine to medium grained sand intermixed with gravel, stones and brick where fill material was encountered and brown, fine to medium grained sand and some silt where native material was encountered. Soil borings were advanced to a depth of 12 feet below grade and ground water was not encountered on-site.

b. Quality Assurance and Quality Control QA/QC Plan

EEA implements a QA/QC Plan to ensure sample integrity and avoid contamination and/or cross-contamination of samples. All sampling equipment is cleaned before each sample is collected. When petroleum hydrocarbon contamination is encountered, all equipment is steam-cleaned. The following procedures are followed in the decontamination process:

Step 1: Steam clean equipment.
Step 2: Scrub with a bristle brush using a non-phosphate detergent (such as Alconox).
Step 3: Rinse with hot tap water.
Step 4: Rinse twice with deionized water.
Step 5: Air dry.
Step 6 Nitric Acid (5%) solution rinse (if sampling for metals)
Step 7: Rinse twice with deionized water.
Step 8: Air dry.

VII QUALIFICATIONS

EEA, Inc. is an environmental consulting firm that has undertaken environmental pollution investigations, development feasibility studies, and environmental site assessment

studies since 1979. These site evaluation studies have been prepared for major lenders, public corporations, businesses, developers and governmental agencies. Approximately 4,000 parcels have been evaluated in the metropolitan New York-New Jersey area during the past twenty years, ranging from Phase I Environmental Site Assessments to comprehensive subsurface hazardous material investigations and testing programs. EEA also prepares bid specifications for remedial cleanup actions and supervises site cleanup.

EEA's principals and senior managers for the hazardous waste investigations each have over 20 years experience in environmental consulting, with established credentials in the field.

Individual qualifications of EEA personnel, including specific credentials of persons involved in the preparation of this report can be provided upon request.

VIII. DISCLAIMER

This report is for use by Mr. Simon Rothkrug of the Rothkrug, Rothkrug, Weinburg & Spector, and is only to be used as a guide in determining the potential for contamination by toxic or hazardous materials on the subject property at the time of the site visit. This Phase II Environmental Subsurface Investigation was undertaken in accordance with generally accepted protocols, including ASTM Standards Related to the Phase II Environmental Site Assessment Process. This Phase II Investigation is based principally on the review of historic and regulatory records (made available within a reasonable time period), relating to past occupants and usage of the subject property, as well as activities at nearby sites, and upon a visual assessment of the subject property, and makes no determinations with respect to portions of the subject property and its structures which were not inspected. Our professional services have been performed using that degree of care and skill ordinarily exercised under similar circumstances by reputable qualified professionals practicing in this or similar situations. The interpretation of the field data is based on good judgement and experience. However, no matter how qualified the professional or detailed the investigation, subsurface conditions cannot always be predicted beyond the points of actual sampling and testing. No other warranty, expressed or implied, is made to the professional advice included in this report.

Any and all liability on the part of EEA, Inc. shall be limited solely to EEA's professional liability insurance (errors and omissions coverage of one million dollars). EEA, Inc. shall have no liability for any other damages, whether consequential, compensatory, punitive, or special, arising out of, incidental to, or as a result of, this assessment. EEA, Inc. assumes no liability for the use of this report by any person or entity other than the institution and/or entities or persons for whom it has been prepared.

MECC Project No	Project M10288
Inspection Date	October 9, 2013
Summary Date	October 18, 2013
Final Report Date	October 24, 2013

4.1 EXECUTIVE SUMMARY

Merritt Environmental Consulting Corp. (MECC) was retained by Monir Management Corp. to conduct a Phase I Environmental Site Assessment (ESA) at 64-02/06 Queens Boulevard, Woodside, Queens, New York 11377.

The on site investigation was conducted on October 19, 2013.

Based on our site reconnaissance, database review and historical investigation, the following Recognized Environmental Conditions (RECs) were noted at the time of our inspection.

A Recognized Environmental Condition means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substance or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under compliance with laws.

ITEM	
1	According to the historical sources reviewed, a Filling Station occupied the site during years 1932-1951. The Sanborn Map Three (3) gasoline tanks present during this time along the 64th Street portion of the building. Until additional information is obtained regarding the closure of the tanks /filling station, this constitutes a Recognized Environmental Condition (REC).

- **Research of the NYC Department of Buildings and our database review indicated that the subject property is an "E" designated site.**

  Lot 32, Tax Block 2325
  64-06 Queens Boulevard
  E-No. E-163
  Effective Date: 06/29/06
  Satisfaction date: Not Reported
  Description: Air Quality – HVAC fuel limited to natural gas, Underground Gasoline Storage Tanks* Testing Protocol, Window Wall Attenuation & Alternate Ventilation

  Lot 30, Tax Block 2325
  Queens Boulevard
  E-No. E-163
  Effective Date: 06/29/06
  Satisfaction date: Not Reported
  Description: Air Quality – HVAC fuel limited to natural gas, Underground Gasoline Storage Tanks* Testing Protocol, Window Wall Attenuation & Alternate Ventilation

The "E" designations would require that the fee owner of the site conduct a testing and sampling protocol and remediation where appropriate, to the satisfaction of the NYCOER before the issuance of a building permit by the Department of Buildings. Once approval is granted by the NYCOER, the work can be performed in accordance to required regulations in order to receive a notice of satisfaction.

Under the NYCOER E-designation program, a comprehensive environmental investigation must be conducted in accordance with receiving a NYCOER notice to proceed-notice of satisfaction. The scope of work required, may uncover additional sub-surface impacts not previously discovered or tested for (IE: pesticides/herbicides/metals).

MECC has not been informed of the future usage of the site. Therefore, we cannot comment on the time frame in which the "E" designation would need to be addressed.

The following de minimis conditions were noted but are not considered Recognized Environmental Conditions (RECs).

A de minimis condition is one that generally does not present a material risk of harm to public health or the environment and that generally would not be subject of an enforcement action if brought to the attention of appropriate governmental agencies (excluding local asbestos & lead situations).

ITEM	
1	The current tenant is an auto parts store. As part of their services, they accept used waste oil and antifreeze from customers. A manifest for the disposal of these products was not provided at the time of our inspection.

No Historical Recognized Environmental Conditions (HRECs) were reported. In addition no evidence of HRECs were observed during our on-site inspection/ identified in our database search/historical review.

A Historical Recognized Environmental Condition (HREC) is an environmental condition which in the past would have been considered a Recognized Environmental Condition (REC), but which may or may not be considered a recognized environmental condition currently. Such as a past release of any hazardous substances or petroleum products which has been remediated, with such remediation accepted by the responsible regulatory agency (for example, as evidenced by the issuance of a no further action letter or equivalent).

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on August 19, 2014 and listed below. The project was identified as your project: **7791-WDNY**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

York Sample ID	Client Sample ID	Matrix	Date Collected	Date Received
14H0759-01	SV-1	Air	08/15/2014	08/19/2014
14H0759-02	SV-2	Air	08/15/2014	08/19/2014

General Notes for York Project (SDG) No.: 14H0759

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

Notes and Definitions

QL-03 This LCS analyte recovered outside of acceptance limits. The LCS contains approximately 70 compounds, a limited number of which may be outside acceptance windows.

ND Analyte NOT DETECTED at the stated Reporting Limit (RL) or above.

RL REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.

MDL METHOD DETECTION LIMIT - the minimum concentration that can be measured and reported with a 99% confidence that the concentration is greater than zero. If requested or required, a value reported below the RL and above the MDL is considered estimated and is noted with a "J" flag.

NR Not reported

RPD Relative Percent Difference

Wet The data has been reported on an as-received (wet weight) basis

Low Bias Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

High Bias High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the MDL, with values between the MDL and the RL being "J" flagged as estimated results.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on August 19, 2014 and listed below. The project was identified as your project: **7791-WDNY.**

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 14H0833

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

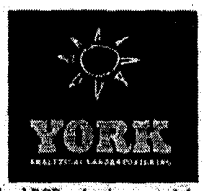
Notes and Definitions

S-08	The recovery of this surrogate was outside of QC limits.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration
ISTD-LO	The internal std associated with this target compound did not meet acceptance criteria (area <50% CCV) at the stated dilution due to matrix effects. Sample was rerun to confirm matrix effects.
CCV-E	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants. Data users should consider anything <10x the blank value as artifact.

ND	Analyte NOT DETECTED at the stated Reporting Limit (RL) or above.
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
MDL	METHOD DETECTION LIMIT - the minimum concentration that can be measured and reported with a 99% confidence that the concentration is greater than zero. If requested or required, a value reported below the RL and above the MDL is considered estimated and is noted with a "J" flag.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.



If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the MDL, with values between the MDL and the RL being "J" flagged as estimated results.

Questions	Response	Comments
Describe the current and former use of the property, including business name(s).	Auto Body Warehouse	
Is there any evidence of current or former service stations, or of commercial\industrial activities that suggest that underground storage tanks may present?	Yes (No) Unknown	
Is there any evidence that aboveground storage tanks may be present?	Yes (No) Unknown	
How is the property building(s) heated and cooled?	Electric & Gas from lines & National Grid	
Is/was there ever a dry cleaner, metal manufacturing facility, or other property occupant that may have used degreasing materials or cleaners?	Yes (No) Unknown	
Is there any evidence that a landfill, dump, waste pile, wastewater lagoon, or other land disposal activity was/is present on the property?	Yes (No) Unknown	
Is there any evidence that hazardous substances or petroleum (paints, solvents, acids, bases, flammables, poisons, fuel oil, or other chemical materials) are/were used on the property?	Yes (No) Unknown	
Is there any evidence that radiological materials or radiological equipment (common in research laboratories, medical facilities, and industrial operations) may be/have been present on the property?	Yes (No) Unknown	
Is there any evidence that electrical equipment, such as transformers, capacitors, and light ballasts, or hydraulic equipment (e.g. lifts, loading dock levelers, and elevators) is/was present on the property?	Yes (No) Unknown	

Is there any evidence that pesticides (including insecticides, fungicides, and rodenticides) have been manufactured or used on the property?	Yes (No) Unknown	
Describe how sanitary waste is managed:	PUBLIC SEWER	
Are there any drains present within the building(s)?	Yes (No) Unknown	
Describe how solid waste (garbage) is managed:	GARBAGE PICK UP	
Are any water supply or monitoring wells present on the property?	Yes No (Unknown)	
Are there any coastal areas, rivers, streams, springs, lakes ponds, swamps, marshes, or other bodies of water on or immediately adjacent to the property? (do not include swimming pools and other similar bodies of water).	Yes (No) Unknown	
Are there any environmental liens recorded for the property? These are often found tin the Exceptions section of a property title report.	Yes (No) Unknown	
Please provide the proposed purchase price and appraised value of the property. If this information is not available, please provide an explanation:	6,000,000 purchase price. 6,300,000 Appraised price.	
Are any previous environmental reports available for the property? If so, copies must be provided.	(Yes) No Unknown

EXECUTIVE SUMMARY

This investigation was completed to address issues presented in a Phase I Environmental Site Assessment (ESA) conducted by G.C. Environmental, Inc. (GCE) issued February 4, 2004, and on the limited soil gas survey issued by Fleming Lee Shue on March 2004. A sampling and analysis program was designed to determine if prior and/or present uses on the subject property have impacted the subsurface soils and environment as outlined in our Scope of Work dated April 26, 2004. The sampling and analysis plan consisted of soil quality testing using analytical test methods consistent with expected parameters and agency soil cleanup guidelines. The following presents an evaluation of our investigation.

EEA conducted the Phase II Environmental Site Assessment based on the finding of the previous Phase I ESA. These findings indicated that the western portion of the site was a gasoline station from circa 1923 to circa 1955. In addition, regulatory records indicated that a permit was issued for a portion of the property for ten (10) buried gasoline tanks and also indicated that there were four (4) gasoline pumps located on the northwestern portion of the site. In addition, the 1932 and the 1951 Sanborn Fire Insurance maps showed three (3) gasoline tanks located on the northwestern portion of the site and labeled it as a "filling station". Based on the information from the previous Phase I, the following tasks were completed during EEA's Phase II Subsurface Investigation:

Geophysical Survey – Magnetometer

During field activities, EEA performed a magnetometer survey over the property to determine if any underground storage tanks (USTs) were present on the property using a Fisher TW-6 magnetometer. The survey was conducted in the arESA of the suspected USTs around the former gasoline service station and auto repair facility. The survey did not indicate that there were any USTs present in the subsurface.

EEA concludes that the tanks had been removed at an earlier time and does not recommend any further action.

Former Gasoline Service Station

At the location of the former gasoline service station, six (6) soil borings were advanced to depth. Of these six soil borings, five (5) soil samples were selected for laboratory analysis based on field observations and field screening via a portable Organic Vapor Analyzer (OVA). Soil samples were analyzed for volatile organic compounds (VOCs) via USEPA Method 8021,

semi-volatile organic compounds (SVOCs) via USEPA Method 8270 and total petroleum hydrocarbons (TPH) via USEPA Method 8015. Results of soil analysis indicated that soil boring B-1 had some low-level concentrations of SVOCS above the New York State Department of Environmental Conservation (NYSDEC) Technical and Administrative Guidance Memorandum (TAGM) criteria. All five soil samples also had detections for TPH, however the concentrations were well below any regulatory guidelines. EEA concludes that the former gasoline station had not significantly impacted soil at the property.

Based on the analytical results, EEA does not recommend any further action in regards to the former gasoline station.

There are no recommendations for additional site investigation or remedial corrective action for this property at this time based upon the information disclosed in our investigation.

I. INTRODUCTION

This investigation was completed to address issues addressed in our Scope of Work dated April 26, 2004. A sampling and analysis program was designed to determine if prior and/or present uses on the subject property have impacted the subsurface soils and environment. The sampling and analysis plan consisted of soil quality testing using analytical test methods consistent with expected parameters and agency soil cleanup guidelines. The following presents an evaluation of our investigation.

EEA conducted the Phase II Environmental Site Assessment based on the finding of the previous Phase I ESA. These findings indicated that the western portion of the site was a gasoline station from circa 1923 to circa 1955. In addition, regulatory records indicated that a permit was issued for a portion of the property for ten (10) buried gasoline tanks and also indicated that there were four (4) gasoline pumps located on the northwestern portion of the site. In addition, the 1932 and the 1951 Sanborn Fire Insurance maps showed three (3) gasoline tanks located on the northwestern portion of the site and labeled it as a "filling station". Based on the information from the previous Phase I, EEA's initiated the Phase II Subsurface Investigation:

EEA initiated field activities on May 10, 2004; all Phase II field activities were completed by that date. This report summarizes the work performed, the results of the investigation, and the recommended remedial action requirements (if any).

II. SCOPE OF WORK PERFORMED

a. Health and Safety Plan

EEA uses a company Generic Health and Safety Plan for all investigative work relating to performing Phase II Environmental Subsurface Investigations. The HASP assigns responsibilities, establishes personal protection standards, recommends operating procedures, and provides for contingencies that may arise during performance of the assessment at the site. The protocols in the HASP apply to all personnel involved in the work activities including EEA, all outside subcontractors, client, or regulatory agencies present during the performance of the work. In addition, the following safety equipment is maintained on-site for responding to potential emergency situations: portable eyewash, ABC fire extinguisher, and first aid kit. Telephone numbers of emergency response units in the area are also posted where all those working at the site can ESAily see them. All personnel working at the site will also be required to receive training in respirator fitting, emergency procedures, equipment decontamination, and specific task procedures. All personnel involved with the collection of soil or water will have successfully completed the 40-hour OSHA Hazardous Materials Training Program.

b. Subsurface Utility Location, Permits and Bonding

EEA notified the New York City/Long Island One Call Center under the New York State Regulation Code 753 prior to initiating the work to identify the location of underground utilities in the vicinity of the proposed boring locations. The confirmation number assigned to the site was #1240288. Any permits for soil boring were obtained from the local agencies. In addition, any license and permit bonding required was secured for the work.

c. Investigation Work Summary

All soil sampling was completed using a Geoprobe Model 54LT using the *Macrocore* soil sampling system. Samples were field screened for volatile organic vapors using an organic vapor meter (OVM). If no reading was found, then the bottom sample or the sample determined to be the most representative was selected for laboratory testing. The geophysical survey was conducted utilizing a Fisher TW-6 magnetometer.

- A geophysical survey (magnetometer) to investigate USTs
- Six (6) soil borings (B-1,B-2, B-3, B-4, B-5 and B-6) to investigate the location of the former gasoline station on-site.

d. Geophysical Survey - Magnetometer

EEA performed a magnetometer survey over the property to determine if any USTs were present on the property. The survey was performed with a Fisher TW-6 magnetometer in the areas of the suspected underground tanks (around the former gasoline station and auto repair facility). The survey did not indicate that there were any USTs present in the subsurface. EEA concludes that these USTs had been removed at an earlier time.

e. Former Gasoline Service Station

Six (6) soil borings were completed in order to investigate the area of the former gasoline service station. The soil borings were completed to a depth of 12 feet using a Geoprobe Model 54LT and *Macrocore* soil sampling system. Each sample was field screened for volatile organic vapors using an OVM. Based on field observations and OVM readings, five (5) soil boring samples were submitted for laboratory analysis. Samples were selected based upon the results of the OVM field screening. The sample with the highest OVM reading was selected for testing. If no reading was found, then the bottom sample or the sample determined to be the most representative was selected for laboratory testing Each sample sent to the laboratory was tested for volatile organic compounds (VOCs via US EPA Method 8021), semi-volatile organic compounds (SVOCs via US EPA Method 8270) and TPH (via US EPA Method 8015). Soil sample B-1 had some low-level concentrations of SVOCs (Benzo (a) Anthracene and Benzo (a) Pyrene) slightly above the NYSDEC TAGM criteria. Also, all five soil samples had detections for TPH, however the concentrations are well below any regulatory guidelines. Based on the

minor detections for SVOCs and TPH, EEA concludes that the former gasoline service station has not impacted subsurface soils on the property.

III. RESULTS OF LABORATORY ANALYSES

Ecotest Laboratories, Inc. (NYSDOH Certification #10320) prepared the results of the soil samples. Tables 1 and 2 present a summary of the results and a comparison to New York State Department of Environmental Conservation (NYSDEC) STARS Memo #1 and Technical and Administrative Guidance Manual (TAGM) cleanup guidelines. The chain-of-custody records, as well as the analytical laboratory data sheets, are presented in the Appendix to this report.

The soil sample collection locations are presented in Figure 1. The soil boring report logs present the field observations made at each soil boring location and site photographs are presented in the Appendix to this report.

IV. FINDINGS AND CONCLUSIONS

a. Geophysical Survey - Magnetometer

The magnetometer survey did not indicate that USTs were still present in the vicinity of the former gasoline service station and auto repair facility. EEA concludes that these tanks had been removed at an earlier time.

b. Former Gasoline Service Station

Six (6) soil borings were advanced in the area of the former gasoline service station, and of these, five (5) soil samples were submitted for laboratory analysis. Analytical results indicate that soil boring B-1 had some low-level concentrations of SVOCS above the NYSDEC TAGM criteria. Also, all five soil samples had detections for TPH, however the concentration were well below any regulatory guidelines. EEA concludes that the former USTs had been removed and that the former USTs have not significantly impacted subsurface conditions at the subject property.

The NYSDEC has developed the "guidelines" in order for DEC case managers to determine potential cleanup recommendations at various sites thoughout the state. The New York City Department of Environmental Protection (NYCDEP) and USEPA have developed similar guidelines. The NYSDEC and NYCDEP consider each site on a case-by-case basis in consideration of the property usage and its location to sensitive human, wildlife and environmental interests. Industrial properties are treated differently than residential or environmentally sensitive areas. In order to determine the specific requirements regarding potential remedial corrective action, EEA recommends that this report is reviewed by the applicable regulating agency.

EEA, Inc.

55 Hilton Avenue
Garden City, New York
(516) 746-4400

Figure 1: Site Location Plan
64-06 Queens Boulevard
Woodside, New York

Job No.: 04716

Drawn By: FI

Date: 5/28/04

V. RECOMMENDATIONS

There are no recommendations for additional site investigation or remedial corrective action for this property at this time based upon the information disclosed in our investigation.

VI. SAMPLING METHODOLOGY

a. Soil Sampling

Soil samples were obtained by utilizing a Geoprobe Model 54 LT utilizing the *Macrocore* soil sampling system. An organic vapor analysis was performed on all soil samples using a Thermo Environmental Instruments Inc. 580B photo-ionization detector (OVM). Generally, the sample producing the highest organic vapor reading was sent to the laboratory for analysis. If no reading was found, the sample was selected based upon visual analysis to be best representative of the location.

Soils at the site consisted of brown, fine to medium grained sand intermixed with gravel, stones and brick where fill material was encountered and brown, fine to medium grained sand and some silt where native material was encountered. Soil borings were advanced to a depth of 12 feet below grade and ground water was not encountered on-site.

b. Quality Assurance and Quality Control QA/QC Plan

EEA implements a QA/QC Plan to ensure sample integrity and avoid contamination and/or cross-contamination of samples. All sampling equipment is cleaned before each sample is collected. When petroleum hydrocarbon contamination is encountered, all equipment is steam-cleaned. The following procedures are followed in the decontamination process:

Step 1: Steam clean equipment.
Step 2: Scrub with a bristle brush using a non-phosphate detergent (such as Alconox).
Step 3: Rinse with hot tap water.
Step 4: Rinse twice with deionized water.
Step 5: Air dry.
Step 6 Nitric Acid (5%) solution rinse (if sampling for metals)
Step 7: Rinse twice with deionized water.
Step 8: Air dry.

VII QUALIFICATIONS

EEA, Inc. is an environmental consulting firm that has undertaken environmental pollution investigations, development feasibility studies, and environmental site assessment

studies since 1979. These site evaluation studies have been prepared for major lenders, public corporations, businesses, developers and governmental agencies. Approximately 4,000 parcels have been evaluated in the metropolitan New York-New Jersey area during the past twenty years, ranging from Phase I Environmental Site Assessments to comprehensive subsurface hazardous material investigations and testing programs. EEA also prepares bid specifications for remedial cleanup actions and supervises site cleanup.

EEA's principals and senior managers for the hazardous waste investigations each have over 20 years experience in environmental consulting, with established credentials in the field.

Individual qualifications of EEA personnel, including specific credentials of persons involved in the preparation of this report can be provided upon request.

VIII. DISCLAIMER

This report is for use by Mr. Simon Rothkrug of the Rothkrug, Rothkrug, Weinburg & Spector, and is only to be used as a guide in determining the potential for contamination by toxic or hazardous materials on the subject property at the time of the site visit. This Phase II Environmental Subsurface Investigation was undertaken in accordance with generally accepted protocols, including ASTM Standards Related to the Phase II Environmental Site Assessment Process. This Phase II Investigation is based principally on the review of historic and regulatory records (made available within a reasonable time period), relating to past occupants and usage of the subject property, as well as activities at nearby sites, and upon a visual assessment of the subject property, and makes no determinations with respect to portions of the subject property and its structures which were not inspected. Our professional services have been performed using that degree of care and skill ordinarily exercised under similar circumstances by reputable qualified professionals practicing in this or similar situations. The interpretation of the field data is based on good judgement and experience. However, no matter how qualified the professional or detailed the investigation, subsurface conditions cannot always be predicted beyond the points of actual sampling and testing. No other warranty, expressed or implied, is made to the professional advice included in this report.

Any and all liability on the part of EEA, Inc. shall be limited solely to EEA's professional liability insurance (errors and omissions coverage of one million dollars). EEA, Inc. shall have no liability for any other damages, whether consequential, compensatory, punitive, or special, arising out of, incidental to, or as a result of, this assessment. EEA, Inc. assumes no liability for the use of this report by any person or entity other than the institution and/or entities or persons for whom it has been prepared.

PHASE II WORK PLAN

1.0 INTRODUCTION

This Phase II Environmental Site Investigation (ESI) Work Plan and Health and Safety Plan (HASP) have been developed for the property located at 64-02 & 64-06 Queens Boulevard in the Woodside section of Queens, New York (the Site). This project has been assigned project number OER Project 15EHAN504Q by the New York City Office of Environmental Remediation (OER). This Work Plan describes the proposed investigation that will address the environmental concerns indentified at the property in the April 2015 Phase I Environmental Site Assessment (ESA) report prepared by FPM Group, Ltd. in coordination with the OER. An E-Designation for Hazardous Materials (E-163) was placed on the Site by the New York City Department of City Planning (DCP) as part of the Maspeth/Woodside Rezoning (CEQR 06DCP065Q). The site-specific HASP (Appendix 2) addresses potential hazards, contaminants of concern based on past use and safety requirements associated with investigation activities in accordance with ASTM and OSHA guidelines.

1.1 Site Location and Current Usage

The Site is located in the Woodside section of Queens, New York and is identified as Block 2325 and Lot 32 on the New York City Tax Map. Figure 1.1.1 is a Site location map. The Site is 16,050-square feet and is bounded by Queens Boulevard to the north, residential buildings to the south, FDNY Rescue Co. 4 and Engine Co. 292 to the east, and 64th Street to the west. Currently, the Site is vacant and contains an 11,000-square-foot one-story commercial building with an asphalt-paved parking lot to the west. Figure 1.1.2 is a Site plan showing the current layout of the Site

1.2 Proposed Redevelopment Plan

The proposed use of the Site will be commercial and residential. Redevelopment will include the construction of a one- to eight-story building with a cellar and sub-cellar to a total depth of 21 feet below grade (fbg).

DRAFT

The layout of the proposed Site development is presented in Figure 1.2.1. The current zoning designation is R7X R4-1 with a C2-3 overlay which permits residential and retail commercial use.

The redevelopment plan includes demolishing the current Site building, with removal and proper offsite disposal of all demolition debris. No sub-grade demolition is anticipated or planned.

The new building will be approximately 15,915 square feet and the sub-cellar will occupy the entire lot, with the exception of approximately 135 square feet on the southeast corner of the Site, which will remain undeveloped. The sub-cellar will contain parking and mechanical rooms. The cellar will contain hotel rooms, mechanical rooms, a lounge, a meeting room, and a terrace. The first floor (ground level) will contain a hotel lobby, hotel rooms, a buffet area, a pantry area, and mechanical rooms. The second and third floors will contain hotel rooms and mechanical rooms. The fourth floor will contain hotel rooms, residential apartments, and mechanical rooms. Floors five through seven will contain residential apartments and mechanical rooms. The eighth floor will contain residential apartments, mechanical rooms, a recreation area, and a terrace. The building will contain 93 hotel rooms, 42 apartments, and three elevators; the total gross area of the building will be 94,524 square feet.

Redevelopment for the sub-cellar will include excavation across the entire Site, with the exception of the 135-square-foot area on the southeast corner, to a depth of 24 fbg. Approximately 14,150 cubic yards of soil will be excavated. Depth to groundwater is estimated at 10 fbg.

1.3 Description of Surrounding Property

The Site is located in a neighborhood with commercial buildings, residential buildings, public facilities and institutions, transportation and utility buildings, open space and recreation areas, and parking areas. The properties in this area are typically zoned R7X with a C2-3 overlay, R4-1, and R5B. The Site is adjoined to the south by residential buildings. The Site is adjoined to the north by a Queens Motor Inn across Queens Boulevard. The Site is adjoined to the west by a residential building with commercial retail space on the first floor across 64th Street. The Site is adjoined to the east by the FDNY Rescue Co. 4 and Engine Co. 292.

DRAFT

2.0 PREVIOUS ENVIRONMENTAL DOCUMENTATION

2.1 Environmental Investigation Reports

The following environmental work plans and reports were developed for the Site:

Phase I Environmental Site Assessment, February 2004, prepared by G.C. Environmental, Inc.

Phase II Environmental Subsurface Investigation, May 28, 2004, prepared by EEA Inc.

Phase I Environmental Site Assessment, October 24, 2013, prepared by Merritt Environmental Consulting Corp.

Phase II Subsurface Investigation, September 3, 2014, prepared by Advanced Cleanup Technologies, Inc.

Phase I Environmental Site Assessment, April 2015, prepared by FPM Group, Ltd.

Digital (PDF) copies of the available above-referenced environmental reports are included as Appendix 1.

2.3 Phase I Summary

The Phase I report was prepared by FPM Group for Queens Blvd Venture, LLC dated April 2015. This Phase I indentified one recognized environmental condition (REC) and one historic recognized environmental condition (HREC):

1. The Site has been owned by various private and commercial entities. No industrial ownership was reported. The Site was originally developed with railroad tracks on the southwest corner of the property prior to 1914. Between 1914 and 1932 a filling station consisting of a one-story garage, a one-story store building, and three gas tanks was developed on the western portion of the property, with the tanks located beneath the northwestern portion of the property. Between 1932 and 1951 a one-story lumber building was developed to the east of the filling station. The subject property was redeveloped with the current commercial building and parking lot in

1960. The Site is currently vacant and was most recently occupied as an Auto Barn auto parts store.

2. The presence of tetrachloroethene (PCE), trichloroethene (TCE), and methylene chloride in the soil vapor below the parking lot, discussed below in Section 2.4, was identified as a REC.

3. The presence of the former filling station and associated gasoline tanks, in conjunction with the 2004 and 2013 Phase II Investigations discussed below in Section 2.4, was identified as an HREC.

4. Groundwater is estimated at a depth of 10 feet below grade (fbg) and generally flows to the west.

2.4 Findings of Previous Environmental Investigation (if applicable)

The *Phase II Environmental Subsurface Investigation* was prepared by EEA Inc. dated May 28, 2004. Pertinent information obtained from this Phase II Investigation is summarized as follows:

1. A previous Phase I ESA identified a permit issued for the Site for 10 gasoline USTs and 4 gasoline pumps located on the northwest portion of the Site.
2. A magnetometer survey did not identify any USTs at the Site.
3. The stratigraphy of the site, from the surface down, consists of 4 to 10 feet of historic fill, generally consisting of a brown fine to medium grained sand with varying amounts of gravel and brick, underlain by 2 to 12 feet of a brown fine to coarse grained sand with varying amounts of cobbles, gravel, and silt.
4. Soil/fill samples collected during the Phase II Investigation showed no volatile organic compounds (VOCs) or semivolatile organic compounds (SVOCs) detected above Track 1 Unrestricted Use SCOs.

The *Phase II Subsurface Investigation* was prepared by Advanced Cleanup Technologies, Inc. dated September 3, 2014. Pertinent information obtained from this Phase II Investigation is summarized as follows:

DRAFT

1. A geophysical survey of the parking lot did not identify any anomalies suggestive of USTs at the Site.

2. The stratigraphy of the site, from the surface down, consists of a brown sand with varying amounts of gravel, silt, and clay.

3. Soil/fill samples collected during the Phase II Investigation showed no VOCs detected above Track 1 Unrestricted Use SCOs, with the exception of acetone. The acetone detections were below the Track 2 Restricted Residential Use SCOs, and acetone was noted to be a common laboratory contaminant. The metals cadmium, copper, lead, nickel, and zinc were the only metals detected above Track 1 Unrestricted Use SCOs. The metals detections were all below the Track 2 Restricted Residential Use SCOs. The metals detections were attributed to the presence of historic fill. No SVOCs, polychlorinated biphenyls (PCBs), or pesticides were detected above the Track 1 Unrestricted Use SCOs.

4. Soil vapor samples collected during the Phase II Investigation showed three VOCs, PCE, TCE, and methylene chloride, detected at levels above the indoor air Air Guideline Values in the October 2006 New York State Department of Health (NYSDOH) "Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York". The PCE and TCE detections were found at levels for which the NYSDOH would require no further action, monitoring, or mitigation (depending on the associated indoor air concentrations of PCE and TCE).

DRAFT

3.0 PHASE II ENVIRONMENTAL SITE INVESTIGATION

3.1 Investigation Rationale

➢ Geophysical Survey

The geophysical survey will be performed across the entire site to investigate for the existence of potential USTs and other subsurface infrastructure. Three gas tanks were identified on historic Sanborn maps and a previous Phase I report identified a permit for 10 gasoline USTs. No evidence of any USTs was identified at the Site during the site inspection for the Phase I ESA.

➢ Soil, Soil Vapor and Groundwater

An investigation of soil, soil vapor and groundwater is being performed to investigate for the existence of potential environmental contamination onsite. The rationale for the borings, soil vapor locations and groundwater wells is as follows:

- Six soil borings (SB-1 through SB-6) will be completed at the site to address historic fill conditions and will generally be evenly spaced across the site. Boring SB-1 will also be used to assess potential impacts from the former gasoline USTs identified on the historic Sanborn maps. The borings located near the east and south Site boundaries will also be used to assess potential impacts from offsite sources. The locations of these borings may change depending on the findings of the geophysical survey.
- Monitoring wells MW-1 and MW-2 will be installed to investigate onsite groundwater on the more downgradient side of the Site. Monitoring well MW-1 will also be used to assess potential impacts from the former gasoline USTs identified on the historic Sanborn maps. Monitoring well MW-3 will be installed on the more upgradient side of the Site and will be used to assess potential impacts from offsite sources. These groundwater monitoring wells will also be used to confirm the groundwater flow direction across the Site.
- Five soil vapor samples (SV-1 through SV-5) will be collected from evenly-spaced locations across the Site to assess potential soil vapor impacts that may be present.

3.2 Investigation Procedures

Prior to invasive work, a one-call utility mark-out will be completed in accordance with local laws to locate buried electric, natural gas, telecommunication utilities, etc.

➢ Geophysical Survey

The geophysical survey will be performed using ground penetrating radar (GPR) and magnetic detection equipment across the entire Site prior to conducting investigative borings. Areas that will be surveyed include the entire building footprint and the asphalt-paved parking lot to the west of the building. See Figure 3.2.1 for the proposed geophysical survey area.

➢ Soil Sampling

A qualified environmental driller will advance six investigative borings at the locations shown on Figure 3.2.1. A qualified environmental professional (QEP) will supervise the sampling work, screen the soil samples for environmental impacts, log the screening results, and collect environmental samples for laboratory analysis. Site work will comply with safety guidelines outlined in the HASP (Appendix 2). The investigative borings will be advanced to 25 feet below grade, which is below the water table and the below the development depth, using a direct-push drill rig. The proposed boring location plan is included as Figure 3.2.1. Soil will be collected continuously to the boring termination depth using a Geoprobe dual-tube sampler with disposable acetate sleeves advanced in five-foot increments.

Each sample will be screened for organic vapors with a calibrated photoionization detector (PID) and evaluated for visual and olfactory indications of potential environmental impacts. Soil descriptions will be recorded by the QEP in a field log.

Two soil samples will be collected from each borehole, including one sample to be collected from the zero to two-foot interval and a deeper sample to be collected in the two-foot interval directly above groundwater, which is expected at a depth of approximately 10 fbg (see Table 3.2.1 for proposed samples). In the event that evidence of contamination is observed in a boring, an additional sample will be taken from that location for the purpose of delineating the contamination. If the boring reaches bedrock at a shallower depth, the deeper soil sample will be

DRAFT

taken from two feet above the bedrock. Samples will not be composite samples but will be discrete grab samples.

➢ Groundwater Sampling

Groundwater is expected to be encountered at 10 fbg. Three temporary groundwater monitoring wells will be installed by inserting (at a minimum), one-inch diameter PVC well screen and riser an estimated five feet into the groundwater via the open boreholes (See Figure 3.2.1 for well locations). The proper screen size will be selected based on the grain size of the soil encountered. In silty conditions, a smaller well screen slot size will be used. The annulus around each well screen will be filled with clean, appropriately-sized silica sand. The wells will then be developed to allow for proper communication between the wells and shallow groundwater. After an equalization period of approximately one week, the wells will be surveyed to a common datum and gauged to determine the depth to groundwater. The groundwater flow direction will be evaluated using these data. The wells will then be sampled using low-flow sampling techniques. One representative groundwater sample will be collected from each well with a peristaltic pump and dedicated polyethylene tubing. Sampling will be conducted in accordance with NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation (May 2010) and Sampling Guidelines and Protocols, dated March 1991. Following sample collection, boreholes will be backfilled with soil cuttings, a bentonite plug in the upper

Table 3.2.1: Sample Matrix

Sample Location Number	Sampling Depth Below Grade (ft.)	Sample Type/Grab-Composite
SB-1	0 - 2	Soil/Grab
	8 - 10, Pending field observations	Soil/Grab
SB-2	0 - 2	Soil/Grab
	8 - 10, Pending field observations	Soil/Grab
SB-3	0 - 2	Soil/Grab
	8 - 10, Pending field observations	Soil/Grab
SB-4	0 - 2	Soil/Grab
	8 - 10, Pending field observations	Soil/Grab

SB-5	0 - 2	Soil/Grab
	8 - 10, Pending field observations	Soil/Grab
SB-6	0 - 2	Soil/Grab
	8 - 10, Pending field observations	Soil/Grab
MW-1	5 - 15 (estimated)	Groundwater/Grab
MW-2	5 - 15 (estimated)	Groundwater/Grab
MW-3	5 - 15 (estimated)	Groundwater/Grab
SV-1	8 - 9	Soil Vapor/Grab
SV-2	8 - 9	Soil Vapor/Grab
SV-3	8 - 9	Soil Vapor/Grab
SV-4	8 - 9	Soil Vapor/Grab
SV-5	8 - 9	Soil Vapor/Grab

portion, and capped with concrete. Visibly contaminated soil cuttings will be placed in sealed and labeled DOT-approved 55-gallon drums pending offsite disposal at a permitted facility.

➢ Soil Vapor Sampling

Five soil gas (screening) samples will be collected from the proposed soil vapor sampling locations on Figure 3.2.1. All samples will be collected in accordance with the Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York (NYSDOH October 2006). Conditions in the field may require adjustment to the sampling locations. The soil vapor probes for samples SV-1 through SV-5 will be installed at depth of approximately eight to nine feet, depending on the depth to groundwater. The soil vapor probes will be installed at least one foot above the smear zone.

The vapor implants will be installed with direct-push sampling equipment or manually using a rotary hammer drill to penetrate the slab, as appropriate. A bentonite seal will be placed at the surface to seal the vapor implants from the surrounding atmosphere. Each implant will be purged prior to sampling; purging will occur at a rate of less than 0.2 L/min.

DRAFT

Samples will be collected in Summa canisters that have been certified clean by the laboratory and analyzed by using USEPA Method TO-15. The flow rate for both purging and sampling will not exceed 0.2 L/min. Sampling will occur for approximately 24 hours, based on the future residential use of the Site. A sample log sheet will be maintained summarizing the sample identification, date and time of sample collection, sampling depth, identity of samplers, sampling methods and devices, soil vapor purge volumes, volume of the soil vapor extracted, vacuum of canisters before and after the samples are collected, apparent moisture content of the sampling zone, and chain of custody protocols.

As part of the vapor intrusion evaluation, a tracer gas will be used in accordance with NYSDOH protocols to provide quality assurance/quality control (QA/QC) to verify the integrity of the soil vapor probe seals. Helium will be used as the tracer gas and a sealed enclosure will serve to keep it in contact with the probe during testing. A portable monitoring device will be used to analyze a sample of soil vapor for the tracer prior to sampling. If the tracer sample results show a significant presence of the tracer, the probe seals will be adjusted to prevent infiltration. As the conclusion of the sampling round, tracer monitoring will be performed a second time to confirm the integrity of the probe seals.

➢ Investigation Derived Waste

Cuttings may be disposed at the site within the borehole that generated them to within 24 inches of the surface unless:

- Free product or grossly contaminated soil, are present in the cuttings;
- The borehole has penetrated an aquitard, aquiclude or other confining layer; or extends significantly into bedrock;
- Backfilling the borehole with cuttings will create a significant path for vertical movement of contaminants. Soil additives (bentonite) may be added to the cuttings to reduce permeability;
- The soil cannot fit into the borehole.

DRAFT

Those soil cuttings needing to be managed on-site will be containerized in clearly labeled DOT approved 55-gallon drums for future off-site disposal. All boreholes which require drill cuttings disposal would ultimately be filled with bentonite chips and hydrated. Disposable sampling equipment including, spoons, gloves, bags, paper towels, etc. that came in contact with environmental media will be double bagged and disposed as municipal trash in a facility trash dumpster as non-hazardous trash.

3.3 Sample Analysis

Soil and groundwater samples will be submitted to a New York State Department of Health (NYSDOH) Environmental Laboratory Accreditation Program (ELAP)-certified laboratory for Full analysis:

- Volatile Organic Compounds by EPA Method 8260;
- Semivolatile organic compounds by EPA Method 8270;
- Pesticides/PCBs by EPA Method 8081/8082; and
- Target Analyte List metals by EPA Method 6010;

If either LNAPL and/or DNAPL are detected, appropriate samples will be collected for characterization and "finger print analysis" and required regulatory reporting (i.e. spills hotline) will be performed.

All groundwater samples will be analyzed for both filtered and unfiltered metals.

Soil vapor samples will be analyzed for VOCs by using USEPA Method TO-15.

3.4 3.4 Reporting

A Phase II ESI Report will be prepared following completion of the field activities and receipt of the laboratory data. The Report will be prepared using the OER template for the Phase II ESI Report and will provide detailed summaries of the investigative findings and soil and groundwater analytical results compared to the NYSDEC Part 375-6.8(a) Unrestricted Used Soil Cleanup Objectives, appropriate Part 375-6.8(b) Restricted Soil Cleanup Objectives (Restricted Residential and Restricted Commercial Use Soil Cleanup Objectives) and NYSDEC Part 703

DRAFT

Groundwater Quality Standards (GQS) (class GA) or Division of Water Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards (AWQS). The Report will include an updated Site Plan and remedial recommendations, as warranted.

DRAFT

4.0 QUALITY ASSURANCE/QUALITY CONTROL

4.1 Quality Assurance/Quality Control Procedures

QA/QC procedures will be used to provide performance information with regard to accuracy, precision, sensitivity, representation, completeness, and comparability associated with the sampling and analysis for this investigation. Field QA/QC procedures will be used (1) to document that samples are representative of actual conditions at the Site and (2) identify possible cross-contamination from field activities or sample transit. Laboratory QA/QC procedures and analyses will be used to demonstrate whether analytical results have been biased either by interfering compounds in the sample matrix, or by laboratory techniques that may have introduced systematic or random errors to the analytical process. A summary of the field and laboratory QA/QC procedures is provided below.

4.2 Field QA/QC

Field QA/QC will include the following procedures:

- Calibration of field equipment, including PID, on a daily basis;
- Analysis of trip blank (VOCs only) and duplicate samples;
- Use of dedicated and/or disposable field sampling equipment;
- Proper sample handling and preservation;
- Proper sample chain of custody documentation; and
- Completion of report logs.

The above procedures will be executed as follows:

- Two duplicate samples (one soil and one groundwater sample) will be collected to evaluate field sampling precision or reproducibility of measurements of the same parameter under the given set of conditions;
- Disposable sampling equipment, including acetate sleeves, latex gloves, and disposable bailers (or sample tubing), will be used to minimize cross-contamination between samples;

DRAFT

- For each of the parameters analyzed, a sufficient sample volume will be collected to adhere to the specific analytical protocol, and provide sufficient sample for reanalysis if necessary;
- Because plasticizers and other organic compounds inherent in plastic containers may contaminate samples requiring organic analysis, samples will be collected in glass containers, with the exception of the nitrate-preserved groundwater sample for metals analysis;
- Appropriate sample preservation techniques, including cold temperature storage at 4° C, will be utilized to ensure that the analytical parameters concentrations do not change between the time of sample collection and analysis; and
- Samples will be analyzed prior to the expiration of the respective holding time for each analytical parameter to ensure the integrity of the analytical results.

4.3 Sample Custody

Sample handling in the field will conform to appropriate sample custody procedures. Field custody procedures include proper sample identification, chain-of-custody forms, and packaging and shipping procedures. Sample labels will be attached to all sampling bottles before field activities begin to ensure proper sample identification. Each label will identify the site and sample location. Styrofoam or bubble wrap will be used to absorb shock and prevent breakage of sample containers. Ice or ice packs will be placed in between the plastic bags for sample preservation purposes.

After each sample is collected and appropriately identified, the following information will be entered into the chain-of-custody form:

- Site name and address;
- Sampler(s)' name(s) and signature(s);
- Names and signatures of persons involved in the chain of possession of samples;
- Sample number;
- Number of containers;

DRAFT

- Sample location;
- Date and time of collection;
- Type of sample, sample matrix and analyses requested;
- Preservation used (if any); and
- Any pertinent field data collected (pH, temperature, conductivity, Dissolved Oxygen [DO]).

The sampler will sign and date the "Relinquished" blank space prior to removing one copy of the custody form and sealing the remaining copies of the form in a Ziploc plastic bag taped to the underside of the sample cooler lid. The sample cooler will be sealed with tape prior to delivery or shipment to the laboratory.

4.4 Report Logs

Field logs and borings logs will be completed during the course of this investigation. A field log will be completed on a daily basis which will describe all field activities including:

- Project number, name, manager, and address;
- The date and time;
- The weather conditions;
- On-site personnel and associated affiliations;
- Description of field activities; and
- Pertinent sample collection information including sample identification numbers, description of samples, location of sampling points, number of samples taken, method of sample collection and any factors that may affect its quality, time of sample collection, name of collector, and field screening results.

A boring log will be completed for each boring and will include the following information:

- Project number, name, manager, and location;
- The date and time;

DRAFT

- Drilling company and method used;
- Boring number;
- Total boring depth and water table depths; and
- Pertinent soil sample information including sample number, interval, depth, amount recovered, color, composition, percent moisture, visual and olfactory observations of contamination, and PID readings.

4.5 Laboratory QA/QC

AN ELAP-certified laboratory will be used for all sample analyses. The laboratory will follow the following QA/QC protocols. All samples will be delivered to the laboratory within 24 hours of sample collection. Samples will be received by laboratory personnel, who will inspect the sample cooler(s) to check the integrity of the custody seals. The cooler(s) will then be opened, the samples unpackaged, and the information on the chain-of-custody form examined. If the shipped samples match those described on the chain-of-custody form, the laboratory sample custodian will sign and date the form on the next "Received" blank and assume responsibility for the samples. If problems are noted with the sample shipment, the laboratory custodian will sign the form and record problems in the "Remarks" box. The custodian will then immediately notify the Project Manager so appropriate follow-up steps can be implemented on a timely basis.

A record of the information detailing the handling of a particular sample through each stage of analysis will be maintained by the laboratory. The record will include:

- Job reference, sample matrix, sample number, and date sampled;
- Date and time received by laboratory, holding conditions, and analytical parameters;
- Extraction date, time and extractor's initials (if applicable), analysis date, time, and analyst's initials; and
- QA batch number, date reviewed, and reviewer's initials.

DRAFT

5.0 HEALTH AND SAFETY PLAN (HASP)

5.1 Health and Safety Plan (HASP)

The investigation Health and Safety Plan (HASP) is included in Appendix 2. The Site Safety Coordinator will be Ben Cancemi. Investigative work performed under this Work Plan will be in full compliance with applicable health and safety laws and regulations, including Site and OSHA worker safety requirements and HAZWOPER requirements. Confined space entry, if any, will comply with OSHA requirements and industry standards and will address potential risks. The parties performing the investigation work will ensure that performance of work is in compliance with the HASP and applicable laws and regulations.

All field personnel involved in investigation activities will participate in training required under 29 CFR 1910.120, including 40-hour hazardous waste operator training and annual 8-hour refresher training. Site Safety Officer will be responsible for maintaining workers training records.

Personnel entering any exclusion zone will be trained in the provisions of the HASP and be required to sign a HASP acknowledgment. Site-specific training will be provided to field personnel. Additional safety training may be added depending on the tasks performed. Emergency telephone numbers will be posted at the site location before any work begins. A safety meeting will be conducted before each shift begins. Topics to be discussed include task hazards and protective measures (physical, chemical, environmental); emergency procedures; PPE levels and other relevant safety topics. Meetings will be documented in a log book or specific form. Potential on-site chemicals of concern include VOCs, SVOCs, Pesticides/PCBs, and Heavy Metals (specifically arsenic, lead, and mercury at a minimum). Information fact sheets for each contaminant group and/or MSDS' are included in the HASP.

An emergency contact sheet with names and phone numbers for all pertinent project personnel as well as regulatory hotline information is included in the HASP. That document will define the specific project contacts for use in case of emergency.

1.0 INTRODUCTION AND SCOPE OF INVESTIGATION

A Phase II Subsurface Investigation was performed by Advanced Cleanup Technologies, Inc. (ACT) from August 14th through August 15th, 2014 at the property located at 64-02/06 Queens Boulevard, Woodside, New York ("the site"). The purpose for the subsurface investigation was to determine any impacts associated with the historical usage of the subject property as a gasoline filling station. The site is also listed with a Hazardous Materials designation E-138 specifically for Underground Gasoline Storage Tanks (USTs) – Testing Protocol, Window Wall Attenuation and Alternate Ventilation and lastly Air Quality – HVAC fuel limited to natural gas.

The scope of work included the performance of a geophysical survey to determine the existence of suspect underground gasoline and fuel oil tanks. The scope of work also included the collection of soil samples from three soil borings, and the sampling of three-soil vapor probes. Finally, the scope of work included the laboratory analysis of six soil samples and two soil vapor samples by a New York State Department of Health (NYSDOH) certified laboratory in accordance with protocols established by the United States Environmental Protection Agency (USEPA).

Soil quality data was compared to New York State Department of Environmental Conservation (NYSDEC) soil cleanup objectives contained in NYSDEC Part 375-6.8(a) Unrestricted Used Soil Cleanup Objectives, appropriate Part 375-6.8(b) Restricted Soil Cleanup Objectives. Soil vapor was data was compared to Table 3.1 of the NYSDOH "Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York", October 2006.

2.0 SITE DESCRIPTION

2.1 Site Location

The site is located on the south side of Queens Boulevard at the intersection with 64th Street in a commercial and residential area in the western portion of the borough of Brooklyn, New York. The site is bounded by 64th Street followed by an eight story commercial and residential apartment building to the west, a three story commercial property to the east, Queens Boulevard followed by a two story Motor Inn to the North two story residential homes to the south.

The nearest surface water body, the Maspeth Creek, is located approximately 2 miles to the southwest and regional groundwater is expected to flow to the southwest towards the Maspeth Creek.

2.2 General Description

The site (Block 2325, Lots 26, 30 and 32) consists of a one story commercial building and a parking lot. The most recent use of the property is for an auto parts retail store (Auto Barn). The site is approximately 16,562 square feet in area and the building has a footprint of approximately 10,926 square feet. A diagram of site features is included as Figure 1.

2.3 Previous Environmental Reports

A Subsurface Investigation Report dated May 28th, 2004, was prepared by EEA Inc. The purpose of the report was to address issues presented in a Phase I Environmental Site Assessment (Phase I) by G.C. Environmental, Inc. in February 2004 and a limited soil gas survey by Fleming Lee Shue in March 2004. The scope of work included the use of a magnetometer for the location of possible USTs, the installation of 6 soil borings and the analysis of five soil samples. The report concluded the following:

- Soil along the northeast portion of the parking lot contained low-level concentrations of semi-volatile organic compounds above regulatory criteria.

- All of the soil samples contained detections of [Total Petroleum Hydrocarbons] below regulatory criteria.

EEA Inc. recommended that the subsurface investigation be presented to the applicable regulatory agency.

A Phase I Environmental Site Assessment report was prepared by Merritt Environmental Consulting Corp. (Merritt) dated October 24th, 2013. The Phase I report identified the following pertinent recognized environmental conditions:

- Historical usage of the property as a gasoline filling station. Historical sources showed three gasoline storage tanks present at the property from 1932-1951;
- Hazardous Materials E-Designation for the subject property E-163 specifically for Underground Gasoline Storage Tanks (USTs) – Testing Protocol, Window Wall Attenuation and Alternate Ventilation and lastly Air Quality – HVAC fuel limited to natural gas.

Available copies of the above-referenced reports are included as Appendix A.

3.0 FINDINGS OF THE INVESTIGATION

3.1 Geophysical Investigation

A geophysical survey was performed on June 30th, 2014 and encompassed all accessible portions of the parking lot. The survey was performed to determine the existence and locations of suspected USTs at the site. The survey notes are included in Appendix B.

The survey was performed utilizing an SIR-2000 GPR Unit and a 500 megahertz transducer, which allowed for the identification of anomalies to a depth of 10 feet bgs. The transducer was pulled along pre-determined transects, emitting radar into the subsurface. The radar signal reflects off stratigraphical materials and foreign objects in the subsurface and back to the transducer based upon differences in the conductivity and dielectric constant of subsurface features. The radar signal is then converted into an electrical signal, which is visually displayed on a video monitor.

No anomalies were identified large enough to be indicative of USTs. Anomalies that were identified were indicative of conduit piping and minor debris at various locations beneath the fairly uniform asphalt parking lot.

GPR is primarily used as a preliminary survey of a property for the development of subsurface information prior to a formal site assessment. Surface cover or obstructions, subsurface soil types and buried debris can mask or conceal the presence and precise locations of underground structures or even suggest their presence when none exist. The presence, absence or precise locations of underground structures indicated during a GPR survey should be confirmed by excavation, subsurface sampling or other invasive procedures.

3.2 Soil Boring Installation

Three soil borings were installed at the locations indicated in Figure 2. The soil borings were installed utilizing a truck-mounted Geoprobe-style drill unit in combination with 5-foot macro-core soil samplers containing dedicated acetate liners. Soil samples were visually examined for lithology and the presence of contamination and field screened utilizing a Photovac 2020 hand held photoionization detector (PID). The PID is capable of detecting organic vapors at concentrations as low as 0.1 parts per million (ppm). All down hole drilling equipment was decontaminated between sampling events to minimize the possibility of cross-contamination. Copies of the boring logs are included in Appendix B.

The soil boring located at SB-1 was installed to a depth of 15 feet bgs in the southern portion of the site in the parking lot. The soil generally consisted of light brown silty sand mixed with pebbles and clay. The water table was not encountered. PID readings were 0.0ppm throughout the boring with a reading of 1.5ppm at 3.5'. A large rock got lodged in the samples at 15'bgs and no sample was collected from the bottom. Soil samples were collected from 3-5' bgs where a slight PID reading was recorded.

Soil boring, SB-2 was installed to a depth of 15 feet bgs in the eastern portion of the parking lot. The soil generally consisted of light brown silty sand mixed with pebbles and clay. The water table was not encountered. PID readings were 0.0 ppm throughout the boring. Soil samples were collected from 3-5' bgs beneath the asphalt and fill layer and 12 to 14 feet bgs.

SB-3 was installed to a depth of 20 feet bgs in the northwestern corner of the parking lot. The soil generally consisted of light brown medium sand mixed with silt and pebbles. The water table was not encountered. PID readings were 0.0 ppm throughout the boring. The sample from 15-20' bgs became lodged in the sampler and recovery efforts compromised the characterization. A composite sample was collected from that depth. Soil samples were collected from 0-4' bgs, 5-8' bgs and 15 to 12 feet bgs.

All soil samples were containerized and placed in a cooler for laboratory analysis and transmitted under chain of custody to York Analytical Laboratories (NYSDOH # 10854). Soil samples were analyzed for VOCs in accordance with USEPA Method 8260, SVOCs in accordance with EPA Method 8270, TAL Metals in accordance with USEPA Method 6000/7000 and PCB's/Pesticides in accordance with USEPA Methods 8081/8082. Copies of the laboratory reports are contained as Appendix C.

3.3 Sub-Slab Soil Vapor Sampling

Two sub-slab soil vapor probes were installed through the asphalt parking lot at the locations indicated in Figure 2. A six-inch woven stainless steel soil vapor implant was installed to a depth of 5 feet bgs in SV-1 and SV-2. The implants were fitted with ¼ inch inner diameter polyethylene tubing. The annulus around the implant was backfilled with glass beads. A three-foot layer of bentonite slurry was placed above the implant to prevent ambient air infiltration. The remainder of the borehole was backfilled with native soil and a bentonite grout seal installed at the ground surface. All drilling equipment was decontaminated between locations to minimize the possibility of cross-contamination.

The portion of polyethylene tube emerging from the ground was connected to a low flow vacuum pump that purged the probe of soil vapor at a rate that did not exceed 0.2 liters per minute. A 6-Liter stainless steel Summa canister with a flow regulator set to a flow rate of approximately 0.025 liters per minute was connected to the polyethylene tubing and collected soil vapor approximately 4 to 6 hours until the canisters were full.

All air samples were collected utilizing 6-Liter stainless steel Summa canisters connected to

low-flow regulators, which were numbered and supplied by York Analytical Laboratories. The regulators were set to a flow rate of approximately 0.025 liters per minute for a 4-6 hour sample. Field notes are provided in Appendix A.

Two air samples were transmitted under chain of custody to York Analytical Laboratories. All samples were analyzed volatile organic compounds (VOCs) in accordance with EPA TO-15. Methodologies used for soil vapor assessment conform to the *NYS DOH Final Guidance on Soil Vapor Intrusion, October 2006.* Copies of the laboratory reports are contained as Appendix B.

3.4 Soil Quality

The analytical results for the soil samples SB-1 (3-5), SB-2 (3-5), SB-2 (12-14), SB-3 (0-4), SB-3 (5-8) and SB-3 (15-20) are summarized in Tables 1 through 4. The soil quality data was compared to unrestricted, restricted residential and commercial use soil cleanup objectives (UUSCOs, RRSCOs and CSCOs) contained in Table 6.8 of 6 NYCRR Part 375.

It can be seen from Table 1 that no VOCs were detected above soil cleanup objectives in SB-1 (3-5), SB-2 (3-5), SB-2 (12-14), SB-3 (15-18) and SB-4 (14-16)). Acetone was the only VOC detected above UUSCO's in SB-3 (0-4) and SB-3 (5-8) and is commonly utilized as a laboratory solvent and a possible artifact from laboratory equipment. SB-3 (0-4) and SB-3 (5-8) contained low-level concentrations of Tetrachloroethene (PCE) below regulatory standards. TCE is a common solvent most commonly utilized in dry cleaning activities.

Table 2 indicates that no SVOCs were detected above soil cleanup objectives. Table 3 summarizes the extent of PCB and Pesticides in the soil beneath the site. No PCBs or Pesticides were detected above method detection limits in any of the samples.

Concentrations of TAL metals in soil beneath the site are summarized in Table 4. A total of 5 metals were detected above cleanup objectives. Copper was detected above UUSCO in SB-2 (3-5) and SB-3 (0-4) with a maximum concentration of 85.7 µg/kg. Lead was detected above its UUSCO in SB-2 (3-5) and SB-3 (0-4) with a maximum concentration of 239 µg/kg. Nickel (32.7 µg/kg) and

Cadmium (3.76 µg/kg) were detected above their respective UUSCOs in SB-2 (3-5). Zinc was found to exceed its UUSCO in SB-2 (3-5) and SB-3 (0-4) with the highest concentration of 1,890 µg/kg. Metals are commonly found at higher concentrations in urban areas due to the presence of fill materials. All of the highest concentrations of metals were detected at the shallow sampling interval, indicating that ground water is unlikely the source of the contamination.

Based on the sampling results described above, the majority of the metal contamination is restricted to shallow soils in middle to northern side of the parking lot. All compounds were detected below their respective restricted residential soil cleanup objectives.

3.5 Sub-Slab Soil Vapor Results

The analytical results for the sub-slab soil vapor samples SV-1 and SV-2 are summarized in Table 5. The soil vapor data collected during this investigation was compared to guidance values in NYSDOH's "Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York" (NYSDOH, 2006).

As shown in Table 5, the soil vapor samples contained levels of both chlorinated and non-chlorinated compounds all below their respective guidance values. The NYSDOH has guidelines for three compounds including Trichloroethene (TCE), Tetrachloroethene (PCE) and Methylene chloride. TCE was detected in SV-2 above its guideline of 5 $\mu g/m^3$ with a concentration of 12 $\mu g/m^3$. PCE was detected in both samples in exceedence of the guideline of 30 $\mu g/m^3$; SV-2 contained the maximum concentration of 460 $\mu g/m^3$. Methylene chloride was detected above its guideline of 60 $\mu g/m^3$ in SV-2 with a concentration of 67 $\mu g/m^3$. TCE, PCE and Methylene chloride are classified as solvents and are commonly found in industrial and urban areas. The most prevalent compound detected in soil vapor was Acetone a common laboratory solvent and a possible artifact from laboratory equipment. Low levels of petroleum compounds were detected in soil vapor and would be consistent with the historic use of the site for a gasoline filling station as well as an auto parts store.

4.0 CONCLUSIONS

The results of this subsurface investigation are contained in this report. Based upon this investigation, ACT makes the following conclusions concerning the soil and groundwater quality beneath the site.

- The GPR survey did not identify the presence of any USTs beneath the site;
- No VOCs except low concentrations of acetone were detected above soil cleanup objectives in the soil beneath the site and acetone appears to be a laboratory artifact;
- Shallow soils beneath the northern section of the parking lot are contaminated with metals above unrestricted use soil cleanup objectives, which could be indicative of historical fill materials commonly found in the area of the site;
- Elevated concentrations of solvents such as TCE, PCE and Methylene chloride in soil vapor should be investigated further and remediated during future development at the property. This can be accomplished through the installation of a vapor barrier and a sub-slab depressurization system;
- The E-designations assigned to the property should be satisfied with the New York City Office of Environmental Remediation (OER) prior to property development. This report should be provided to them for review and comments.
- No significant soil contamination was found beneath the site and the contamination present does not pose a threat to the surrounding area.

EXCLUSIONS AND DISCLAIMER

The purpose of this investigation was to assess the potential environmental liabilities at the subject site with respect to data, which Advanced Cleanup Technologies, Inc. has accumulated during the Phase II Environmental Site Assessment. The conclusions presented in this report are based solely on the observations of the site at the time of the investigation. Data provided, including information provided by others, was utilized in assessing the site conditions. The accuracy of this report is subject to the accuracy of the information provided. Advanced Cleanup Technologies, Inc. is not responsible for areas not seen or information not collected. This report is given without a warranty or guarantee of any kind, expressed or implied. Advanced Cleanup Technologies, Inc. assumes no responsibility for losses associated with the use of this report.

EXECUTIVE SUMMARY

This investigation was completed to address issues presented in a Phase I Environmental Site Assessment (ESA) conducted by G.C. Environmental, Inc. (GCE) issued February 4, 2004, and on the limited soil gas survey issued by Fleming Lee Shue on March 2004. A sampling and analysis program was designed to determine if prior and/or present uses on the subject property have impacted the subsurface soils and environment as outlined in our Scope of Work dated April 26, 2004. The sampling and analysis plan consisted of soil quality testing using analytical test methods consistent with expected parameters and agency soil cleanup guidelines. The following presents an evaluation of our investigation.

EEA conducted the Phase II Environmental Site Assessment based on the finding of the previous Phase I ESA. These findings indicated that the western portion of the site was a gasoline station from circa 1923 to circa 1955. In addition, regulatory records indicated that a permit was issued for a portion of the property for ten (10) buried gasoline tanks and also indicated that there were four (4) gasoline pumps located on the northwestern portion of the site. In addition, the 1932 and the 1951 Sanborn Fire Insurance maps showed three (3) gasoline tanks located on the northwestern portion of the site and labeled it as a "filling station". Based on the information from the previous Phase I, the following tasks were completed during EEA's Phase II Subsurface Investigation:

Geophysical Survey – Magnetometer

During field activities, EEA performed a magnetometer survey over the property to determine if any underground storage tanks (USTs) were present on the property using a Fisher TW-6 magnetometer. The survey was conducted in the arESA of the suspected USTs around the former gasoline service station and auto repair facility. The survey did not indicate that there were any USTs present in the subsurface.

EEA concludes that the tanks had been removed at an earlier time and does not recommend any further action.

Former Gasoline Service Station

At the location of the former gasoline service station, six (6) soil borings were advanced to depth. Of these six soil borings, five (5) soil samples were selected for laboratory analysis based on field observations and field screening via a portable Organic Vapor Analyzer (OVA). Soil samples were analyzed for volatile organic compounds (VOCs) via USEPA Method 8021,

semi-volatile organic compounds (SVOCs) via USEPA Method 8270 and total petroleum hydrocarbons (TPH) via USEPA Method 8015. Results of soil analysis indicated that soil boring B-1 had some low-level concentrations of SVOCS above the New York State Department of Environmental Conservation (NYSDEC) Technical and Administrative Guidance Memorandum (TAGM) criteria. All five soil samples also had detections for TPH, however the concentrations were well below any regulatory guidelines. EEA concludes that the former gasoline station had not significantly impacted soil at the property.

Based on the analytical results, EEA does not recommend any further action in regards to the former gasoline station.

There are no recommendations for additional site investigation or remedial corrective action for this property at this time based upon the information disclosed in our investigation.

I. INTRODUCTION

This investigation was completed to address issues addressed in our Scope of Work dated April 26, 2004. A sampling and analysis program was designed to determine if prior and/or present uses on the subject property have impacted the subsurface soils and environment. The sampling and analysis plan consisted of soil quality testing using analytical test methods consistent with expected parameters and agency soil cleanup guidelines. The following presents an evaluation of our investigation.

EEA conducted the Phase II Environmental Site Assessment based on the finding of the previous Phase I ESA. These findings indicated that the western portion of the site was a gasoline station from circa 1923 to circa 1955. In addition, regulatory records indicated that a permit was issued for a portion of the property for ten (10) buried gasoline tanks and also indicated that there were four (4) gasoline pumps located on the northwestern portion of the site. In addition, the 1932 and the 1951 Sanborn Fire Insurance maps showed three (3) gasoline tanks located on the northwestern portion of the site and labeled it as a "filling station". Based on the information from the previous Phase I, EEA's initiated the Phase II Subsurface Investigation:

EEA initiated field activities on May 10, 2004; all Phase II field activities were completed by that date. This report summarizes the work performed, the results of the investigation, and the recommended remedial action requirements (if any).

II. SCOPE OF WORK PERFORMED

a. Health and Safety Plan

EEA uses a company Generic Health and Safety Plan for all investigative work relating to performing Phase II Environmental Subsurface Investigations. The HASP assigns responsibilities, establishes personal protection standards, recommends operating procedures, and provides for contingencies that may arise during performance of the assessment at the site. The protocols in the HASP apply to all personnel involved in the work activities including EEA, all outside subcontractors, client, or regulatory agencies present during the performance of the work. In addition, the following safety equipment is maintained on-site for responding to potential emergency situations: portable eyewash, ABC fire extinguisher, and first aid kit. Telephone numbers of emergency response units in the area are also posted where all those working at the site can ESAily see them. All personnel working at the site will also be required to receive training in respirator fitting, emergency procedures, equipment decontamination, and specific task procedures. All personnel involved with the collection of soil or water will have successfully completed the 40-hour OSHA Hazardous Materials Training Program.

b. Subsurface Utility Location, Permits and Bonding

EEA notified the New York City/Long Island One Call Center under the New York State Regulation Code 753 prior to initiating the work to identify the location of underground utilities in the vicinity of the proposed boring locations. The confirmation number assigned to the site was #1240288. Any permits for soil boring were obtained from the local agencies. In addition, any license and permit bonding required was secured for the work.

c. Investigation Work Summary

All soil sampling was completed using a Geoprobe Model 54LT using the *Macrocore* soil sampling system. Samples were field screened for volatile organic vapors using an organic vapor meter (OVM). If no reading was found, then the bottom sample or the sample determined to be the most representative was selected for laboratory testing. The geophysical survey was conducted utilizing a Fisher TW-6 magnetometer.

- A geophysical survey (magnetometer) to investigate USTs
- Six (6) soil borings (B-1,B-2, B-3, B-4, B-5 and B-6) to investigate the location of the former gasoline station on-site.

d. Geophysical Survey - Magnetometer

EEA performed a magnetometer survey over the property to determine if any USTs were present on the property. The survey was performed with a Fisher TW-6 magnetometer in the areas of the suspected underground tanks (around the former gasoline station and auto repair facility). The survey did not indicate that there were any USTs present in the subsurface. EEA concludes that these USTs had been removed at an earlier time.

e. Former Gasoline Service Station

Six (6) soil borings were completed in order to investigate the area of the former gasoline service station. The soil borings were completed to a depth of 12 feet using a Geoprobe Model 54LT and *Macrocore* soil sampling system. Each sample was field screened for volatile organic vapors using an OVM. Based on field observations and OVM readings, five (5) soil boring samples were submitted for laboratory analysis. Samples were selected based upon the results of the OVM field screening. The sample with the highest OVM reading was selected for testing. If no reading was found, then the bottom sample or the sample determined to be the most representative was selected for laboratory testing Each sample sent to the laboratory was tested for volatile organic compounds (VOCs via US EPA Method 8021), semi-volatile organic compounds (SVOCs via US EPA Method 8270) and TPH (via US EPA Method 8015). Soil sample B-1 had some low-level concentrations of SVOCs (Benzo (a) Anthracene and Benzo (a) Pyrene) slightly above the NYSDEC TAGM criteria. Also, all five soil samples had detections for TPH, however the concentrations are well below any regulatory guidelines. Based on the

minor detections for SVOCs and TPH, EEA concludes that the former gasoline service station has not impacted subsurface soils on the property.

III. RESULTS OF LABORATORY ANALYSES

Ecotest Laboratories, Inc. (NYSDOH Certification #10320) prepared the results of the soil samples. Tables 1 and 2 present a summary of the results and a comparison to New York State Department of Environmental Conservation (NYSDEC) STARS Memo #1 and Technical and Administrative Guidance Manual (TAGM) cleanup guidelines. The chain-of-custody records, as well as the analytical laboratory data sheets, are presented in the Appendix to this report.

The soil sample collection locations are presented in Figure 1. The soil boring report logs present the field observations made at each soil boring location and site photographs are presented in the Appendix to this report.

IV. FINDINGS AND CONCLUSIONS

a. Geophysical Survey - Magnetometer

The magnetometer survey did not indicate that USTs were still present in the vicinity of the former gasoline service station and auto repair facility. EEA concludes that these tanks had been removed at an earlier time.

b. Former Gasoline Service Station

Six (6) soil borings were advanced in the area of the former gasoline service station, and of these, five (5) soil samples were submitted for laboratory analysis. Analytical results indicate that soil boring B-1 had some low-level concentrations of SVOCS above the NYSDEC TAGM criteria. Also, all five soil samples had detections for TPH, however the concentration were well below any regulatory guidelines. EEA concludes that the former USTs had been removed and that the former USTs have not significantly impacted subsurface conditions at the subject property.

The NYSDEC has developed the "guidelines" in order for DEC case managers to determine potential cleanup recommendations at various sites thoughout the state. The New York City Department of Environmental Protection (NYCDEP) and USEPA have developed similar guidelines. The NYSDEC and NYCDEP consider each site on a case-by-case basis in consideration of the property usage and its location to sensitive human, wildlife and environmental interests. Industrial properties are treated differently than residential or environmentally sensitive areas. In order to determine the specific requirements regarding potential remedial corrective action, EEA recommends that this report is reviewed by the applicable regulating agency.

Date: 5/28/04

V. RECOMMENDATIONS

There are no recommendations for additional site investigation or remedial corrective action for this property at this time based upon the information disclosed in our investigation.

VI. SAMPLING METHODOLOGY

a. Soil Sampling

Soil samples were obtained by utilizing a Geoprobe Model 54 LT utilizing the *Macrocore* soil sampling system. An organic vapor analysis was performed on all soil samples using a Thermo Environmental Instruments Inc. 580B photo-ionization detector (OVM). Generally, the sample producing the highest organic vapor reading was sent to the laboratory for analysis. If no reading was found, the sample was selected based upon visual analysis to be best representative of the location.

Soils at the site consisted of brown, fine to medium grained sand intermixed with gravel, stones and brick where fill material was encountered and brown, fine to medium grained sand and some silt where native material was encountered. Soil borings were advanced to a depth of 12 feet below grade and ground water was not encountered on-site.

b. Quality Assurance and Quality Control QA/QC Plan

EEA implements a QA/QC Plan to ensure sample integrity and avoid contamination and/or cross-contamination of samples. All sampling equipment is cleaned before each sample is collected. When petroleum hydrocarbon contamination is encountered, all equipment is steam-cleaned. The following procedures are followed in the decontamination process:

Step 1: Steam clean equipment.
Step 2: Scrub with a bristle brush using a non-phosphate detergent (such as Alconox).
Step 3: Rinse with hot tap water.
Step 4: Rinse twice with deionized water.
Step 5: Air dry.
Step 6 Nitric Acid (5%) solution rinse (if sampling for metals)
Step 7: Rinse twice with deionized water.
Step 8: Air dry.

VII QUALIFICATIONS

EEA, Inc. is an environmental consulting firm that has undertaken environmental pollution investigations, development feasibility studies, and environmental site assessment

studies since 1979. These site evaluation studies have been prepared for major lenders, public corporations, businesses, developers and governmental agencies. Approximately 4,000 parcels have been evaluated in the metropolitan New York-New Jersey area during the past twenty years, ranging from Phase I Environmental Site Assessments to comprehensive subsurface hazardous material investigations and testing programs. EEA also prepares bid specifications for remedial cleanup actions and supervises site cleanup.

EEA's principals and senior managers for the hazardous waste investigations each have over 20 years experience in environmental consulting, with established credentials in the field.

Individual qualifications of EEA personnel, including specific credentials of persons involved in the preparation of this report can be provided upon request.

VIII. DISCLAIMER

This report is for use by Mr. Simon Rothkrug of the Rothkrug, Rothkrug, Weinburg & Spector, and is only to be used as a guide in determining the potential for contamination by toxic or hazardous materials on the subject property at the time of the site visit. This Phase II Environmental Subsurface Investigation was undertaken in accordance with generally accepted protocols, including ASTM Standards Related to the Phase II Environmental Site Assessment Process. This Phase II Investigation is based principally on the review of historic and regulatory records (made available within a reasonable time period), relating to past occupants and usage of the subject property, as well as activities at nearby sites, and upon a visual assessment of the subject property, and makes no determinations with respect to portions of the subject property and its structures which were not inspected. Our professional services have been performed using that degree of care and skill ordinarily exercised under similar circumstances by reputable qualified professionals practicing in this or similar situations. The interpretation of the field data is based on good judgement and experience. However, no matter how qualified the professional or detailed the investigation, subsurface conditions cannot always be predicted beyond the points of actual sampling and testing. No other warranty, expressed or implied, is made to the professional advice included in this report.

Any and all liability on the part of EEA, Inc. shall be limited solely to EEA's professional liability insurance (errors and omissions coverage of one million dollars). EEA, Inc. shall have no liability for any other damages, whether consequential, compensatory, punitive, or special, arising out of, incidental to, or as a result of, this assessment. EEA, Inc. assumes no liability for the use of this report by any person or entity other than the institution and/or entities or persons for whom it has been prepared.

4.1 EXECUTIVE SUMMARY

Merritt Environmental Consulting Corp. (MECC) was retained by Monir Management Corp. to conduct a Phase I Environmental Site Assessment (ESA) at 64-02/06 Queens Boulevard, Woodside, Queens, New York 11377.

The on site investigation was conducted on October 19, 2013.

Based on our site reconnaissance, database review and historical investigation, the following Recognized Environmental Conditions (RECs) were noted at the time of our inspection.

A Recognized Environmental Condition means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substance or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under compliance with laws.

ITEM	
1	According to the historical sources reviewed, a Filling Station occupied the site during years 1932-1951. The Sanborn Map Three (3) gasoline tanks present during this time along the 64th Street portion of the building. Until additional information is obtained regarding the closure of the tanks /filling station, this constitutes a Recognized Environmental Condition (REC).

- **Research of the NYC Department of Buildings and our database review indicated that the subject property is an "E" designated site.**

Lot 32, Tax Block 2325
64-06 Queens Boulevard
E-No. E-163
Effective Date: 06/29/06
Satisfaction date: Not Reported
Description: Air Quality – HVAC fuel limited to natural gas, Underground Gasoline Storage Tanks* Testing Protocol, Window Wall Attenuation & Alternate Ventilation

Lot 30, Tax Block 2325
Queens Boulevard
E-No. E-163
Effective Date: 06/29/06
Satisfaction date: Not Reported
Description: Air Quality – HVAC fuel limited to natural gas, Underground Gasoline Storage Tanks* Testing Protocol, Window Wall Attenuation & Alternate Ventilation

The "E" designations would require that the fee owner of the site conduct a testing and sampling protocol and remediation where appropriate, to the satisfaction of the NYCOER before the issuance of a building permit by the Department of Buildings. Once approval is granted by the NYCOER, the work can be performed in accordance to required regulations in order to receive a notice of satisfaction.

Under the NYCOER E-designation program, a comprehensive environmental investigation must be conducted in accordance with receiving a NYCOER notice to proceed-notice of satisfaction. The scope of work required, may uncover additional sub-surface impacts not previously discovered or tested for (IE: pesticides/herbicides/metals).

MECC has not been informed of the future usage of the site. Therefore, we cannot comment on the time frame in which the "E" designation would need to be addressed.

The following de minimis conditions were noted but are not considered Recognized Environmental Conditions (RECs).

A de minimis condition is one that generally does not present a material risk of harm to public health or the environment and that generally would not be subject of an enforcement action if brought to the attention of appropriate governmental agencies (excluding local asbestos & lead situations).

	ITEM
1	The current tenant is an auto parts store. As part of their services, they accept used waste oil and antifreeze from customers. A manifest for the disposal of these products was not provided at the time of our inspection.

No Historical Recognized Environmental Conditions (HRECs) were reported. In addition no evidence of HRECs were observed during our on-site inspection/ identified in our database search/historical review.

A Historical Recognized Environmental Condition (HREC) is an environmental condition which in the past would have been considered a Recognized Environmental Condition (REC), but which may or may not be considered a recognized environmental condition currently. Such as a past release of any hazardous substances or petroleum products which has been remediated, with such remediation accepted by the responsible regulatory agency (for example, as evidenced by the issuance of a no further action letter or equivalent).

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on August 19, 2014 and listed below. The project was identified as your project: **7791-WDNY**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 14H0759

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

Notes and Definitions

QL-03 This LCS analyte recovered outside of acceptance limits. The LCS contains approximately 70 compounds, a limited number of which may be outside acceptance windows.

ND Analyte NOT DETECTED at the stated Reporting Limit (RL) or above.

RL REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.

MDL METHOD DETECTION LIMIT - the minimum concentration that can be measured and reported with a 99% confidence that the concentration is greater than zero. If requested or required, a value reported below the RL and above the MDL is considered estimated and is noted with a "J" flag.

NR Not reported

RPD Relative Percent Difference

Wet The data has been reported on an as-received (wet weight) basis

Low Bias Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

High Bias High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the MDL, with values between the MDL and the RL being "J" flagged as estimated results.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on August 19, 2014 and listed below. The project was identified as your project: **7791-WDNY**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 14H0833

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

Notes and Definitions

S-08	The recovery of this surrogate was outside of QC limits.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
ISTD-LO	The internal std associated with this target compound did not meet acceptance criteria (area <50% CCV) at the stated dilution due to matrix effects. Sample was rerun to confirm matrix effects.
CCV-E	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants. Data users should consider anything <10x the blank value as artifact.

ND	Analyte NOT DETECTED at the stated Reporting Limit (RL) or above.
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
MDL	METHOD DETECTION LIMIT - the minimum concentration that can be measured and reported with a 99% confidence that the concentration is greater than zero. If requested or required, a value reported below the RL and above the MDL is considered estimated and is noted with a "J" flag.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the MDL, with values between the MDL and the RL being "J" flagged as estimated results.

SECTION 1.0
INTRODUCTION

This Health and Safety Plan (HASP) has been written for compliance with "OSHA Hazardous Waste Operations Standards (29 CFR 1910.120)", OSHA Construction Standard 29 CFR 1926, the guidance documents, "Standard Operating Safety Guidelines (Office of Solid Waste and Emergency Response, 1988)" and the "Occupational Safety and Health Guidance Manual for Hazardous Waste Activities" (U.S. Department of Health and Human Services, 1985).

1.1 Scope and Applicability of the HASP

This HASP is designed to be applicable to locations where activities associated with the sampling of groundwater, soil, and soil vapor are performed at or in proximity to the Site. This HASP may also be modified or amended to meet specific needs of the work proposed. This HASP will detail the Site safety procedures, Site background, and safety monitoring. Contractors will be required to adopt this HASP in full.

The Health and Safety Officer (HSO) will be present at the Site to inspect the implementation of the HASP; however, it is the sole responsibility of the contractor(s) to comply with the HASP.

The HASP has been formulated as a guide to complement professional judgment and experience. The appropriateness of the information presented should always be evaluated with respect to unforeseen Site conditions which may arise.

1.2 Site Work Zone and Visitors

The Site work zone (a.k.a. exclusion zone) during groundwater, soil, and soil vapor sampling activities will be a 30-foot radius about the work location. This work zone may be extended if, in the judgment of the health and safety officer (HSO), Site conditions warrant a larger work zone.

No visitors will be permitted within the work zone without the consent of the HSO. All visitors will be required to be familiar with, and comply with, the HASP. The HSO will deny access to those whose presence within the work zone is unnecessary or those who are deemed by the HSO to be in non-compliance with the HASP.

All Site workers including the contractors will be required to have 40-hour hazardous material training (eight-hour refresher courses annually), respirator fit test certification, and medical surveillance as stated in 29 CFR 1910.120.

The HSO will also give an on-Site health and safety discussion to all Site personnel, including the contractors, prior to initiating the Site work. Workers not in attendance during the health and safety talk will be required to have the discussion with the HSO prior to entering the work zone.

Emergency telephone numbers and directions to the nearest hospital are found in Table 1.2.1.

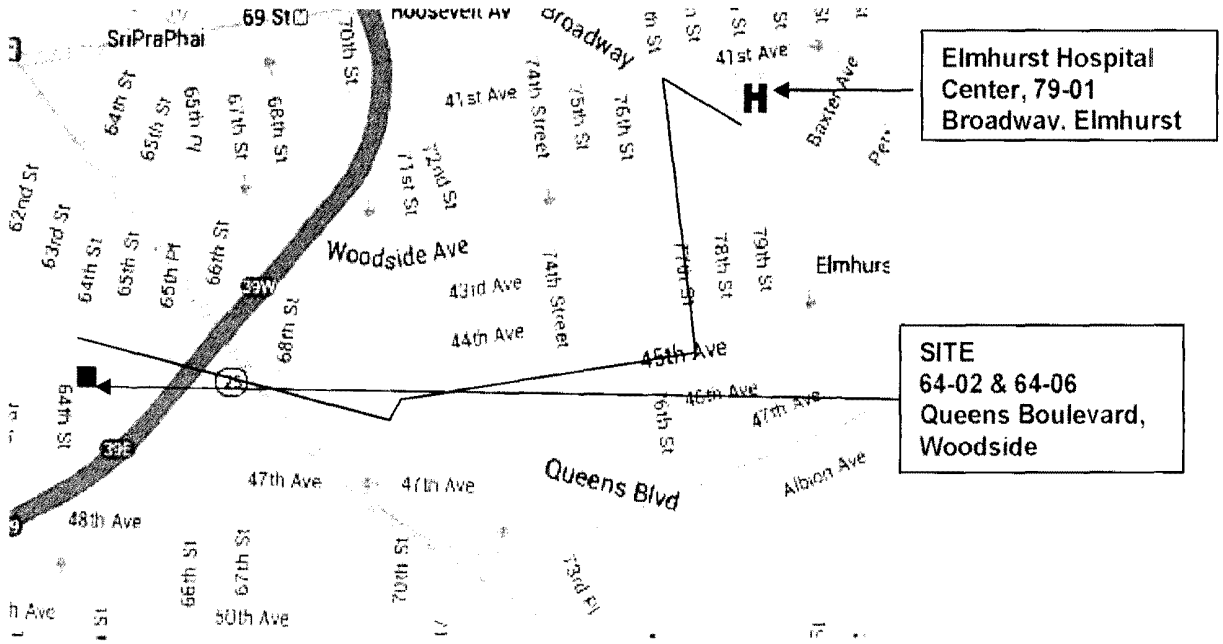
Elmhurst Hospital Center	718-334-4000

FPM Contact Personnel (Office: 631-737-6200)

Dr. Kevin J. Phillips, P.E.	Cell # 631-374-6066
Ben Cancemi, Project Manager and Health and Safety Officer	Cell # 516-383-7106
Stephanie Davis, Project Coordinator, QA/QC Officer	Cell # 516-381-3400
George Holmes, Alternate Health & Safety Officer	Cell # 631-512-1077

Directions to Elmhurst Hospital Center (718-334-4000)

Turn right from the north side of the Site onto Queens Boulevard and head east about one-half mile to 45th Avenue. Turn left onto 45th Avenue and continue east approximately one-half of a mile to 77th Street. Turn left onto 77th Street and continue north approximately one-quarter mile to Broadway. Turn right onto Broadway and continue approximately one-tenth mile. Elmhurst Hospital Center will be on the left.



SECTION 2.0
KEY PERSONNEL AND RESPONSIBILITIES

The project manager and field activities manager for this project will be Ben Cancemi. Mr. Cancemi will also be the primary HSO. The project field staff may include Stephanie Davis, John Bukoski, and/or George Holmes. Contractor personnel may also be on Site. In the event that Mr. Cancemi is not onsite, the senior FPM staff member onsite will act as HSO and will report to the project manager. Contractor personnel will be provided with health and safety information by the HSO.

SECTION 3.0
SITE BACKGROUND

3.1 Site History and Potential Chemical Constituents at the Site

The Site is located at 64-02 & 64-06 Queens Boulevard, Woodside, New York. There is a vacant approximately 11,000-square-foot one-story commercial building and associated asphalt-paved parking lot at the site. The site is e-designated for hazardous materials. Groundwater, soil, and/or soil vapor at the Site may be impacted with petroleum-related chemicals, the volatile organic compounds (VOCs) acetone, methylene chloride, tetrachloroethene (PCE), trichloroethene (TCE), and the metals cadmium, copper, lead, nickel, and zinc. See Table 3.1.1 below for a list of typical petroleum chemicals and VOCs with threshold limit values.

TABLE 3.1.1
PRIMARY CHEMICALS WITH THRESHOLD LIMIT VALUES
64-02 & 64-06 QUEENS BOULEVARD
WOODSIDE, NEW YORK

Contaminant	Short Term Exposure Limit (STEL) 15 Minutes	Time-Weighted Average Eight-Hour Exposure Limit
Acetone	1,000 ppm	750 ppm
Benzene	5 ppm	1 ppm
Ethylbenzene	125 ppm	100 ppm
Methylene chloride	125 ppm	25 ppm
o-Xylene	150 ppm	100 ppm
m,p-Xylene	150 ppm	100 ppm
Tetrachloroethene	100 ppm	100 ppm
Toluene	150 ppm	100 ppm
Trichloroethene	200 ppm	100 ppm

SECTION 4.0
TASK/OPERATION HEALTH AND SAFETY ANALYSIS

This section will present health and safety analyses for the groundwater, soil, and soil vapor sampling activities.

4.1 Safety Analysis

Sampling activities will generally be performed by FPM personnel, although contractors will be utilized to provide access to the subsurface with the use of heavy equipment such as direct-push rigs. Safety concerns will include risk of injury due to being struck by equipment, being trapped between moving equipment parts, being struck by dropped materials, and hearing damage due to equipment noise. Site personnel will take precautions against these risks when working in the vicinity of heavy equipment by being aware of equipment locations and movement, by wearing steel-toed boots and hard hats, and by using hearing protection, if necessary. Site personnel who have not previously worked in the vicinity of heavy equipment will be paired with an experienced person for at least one day to familiarize themselves with heavy equipment operations and safety procedures.

A calibrated photoionization detector (PID) will be used to monitor VOCs in the worker's breathing zone during performance of soil borings. Steady-state PID readings greater than 10 ppm in the worker's breathing zone will require upgrading to Level C personal protective equipment. The NYC OER will be notified if there is a need to upgrade to Level C protection. Steady-state readings, for this purpose, will be defined as readings between 10 and 20 parts per million (ppm) above background for a minimum of ten seconds. Readings will be obtained at points approximately one foot above and then around the borehole. These points will define the worker's breathing zone. Level C personal protection, if implemented, will include full-face air-purifying respirators with dust and organic vapor cartridges (personal protective equipment will be7 described in greater detail in Section 7.0). All FPM personnel and contractors must be properly trained and fit tested prior to donning respirators.

Upon encountering PID levels greater than 20 ppm above background in the worker's breathing zone, work will stop until the source of vapors is abated and readings are less than 20 ppm above background. If, at any time, PID readings exceed steady-state levels greater than 50 ppm above background, or any conditions exist which the HSO determines will require Level B personal protective equipment, all work at the Site will cease immediately and all personnel will evacuate the work zone. Evacuation will occur in the upwind direction if discernable. Level B conditions are not anticipated to be encountered; however, if level B conditions arise, no Site work will be performed by FPM or contractors and a complete evaluation of the operation will be performed and this HASP will be modified.

All personnel who may directly contact soil or groundwater will be required to wear chemical-resistant gloves (such as butyl or nitrile) when the potential for dermal contact with the soil or groundwater is possible. Dermal contact with Site soil or groundwater will be avoided.

Hard hats and steel-toe, steel-shank safety boots will be required when work is performed in the vicinity of heavy equipment.

4.2 Other Safety Considerations

4.2.1 Noise

During sampling activities, operation of a direct push rig, or any other operation which may generate potentially harmful levels of noise, the HSO will monitor noise levels with a Realistic[tm] hand-held sound level meter. Noise levels will be monitored in decibels (dBs) in the A-weighted, slow-response mode. Noise level readings that exceed the 29 CFR 1910.95 permissible noise exposure limits will require hearing protection (see Table 4.2.1.1 for permissible noise exposures).

Hearing protection will be available to all Site workers. The hearing protection will consist of foam, expansion-fit earplugs (or other approvable hearing protection) with an Environmental Protection Agency noise reduction rating of at least 29 dB. Hearing protection must alleviate worker exposure to noise to an eight-hour time-weighted average of 85 dB or below. In the event that the hearing protection is inadequate, work will cease until a higher level of hearing protection can be incorporated.

TABLE 4.2.1.1
PERMISSIBLE NOISE EXPOSURES*

Duration Per Day Hours	Sound Level dBA Slow Response
8	90
6	92
4	95
3	97
2	100
1.5	102
1	105
0.5	110
0.25	115

Notes:

When the daily noise exposure is composed of two or more periods of noise exposure of different levels, their combined effect should be considered, rather than the individual effect of each. If the sum of the following fractions: $C_1/T_1+C_2/T_2$ C_6/T_6 exceeds unity, then, the mixed exposure should be considered to exceed the limit value. Cn indicates the total time of exposure at a specified noise level, and Tn indicates the total time of exposure permitted at that level.

Exposure to impulsive or impact noise should not exceed 140 dB peak sound pressure level.

*Standards derived from 29 CFR 1910.95

4.2.2 Slip/Trip/Fall Preventative Measures

To reduce the potential for slipping, tripping, or falling, the work zone will be kept clear of unnecessary equipment. All Site workers will be required to wear work boots with adequate tread to reduce the potential for slipping (work boots must be leather or chemical-resistant and contain steel toes and steel shanks).

4.2.3 Insects and Ticks

Insect and tick problems are expected to be minimal. Potential insect problems include, but are not limited to, bees, wasps, and hornets. Prior to commencement of work, each work area will be surveyed for nests and hives to reduce the possibility of disturbing these insects. In addition, each Site worker will be asked to disclose any allergies related to insect stings or bites. The worker will be requested to keep his or her anti-allergy medicine on Site.

Tick species native to Long Island consist of the pinhead-sized deer tick and the much-larger dog tick. Ticks are not anticipated at the Site due to the paucity of suitable habitat.

4.2.4 Heat/Cold Stress

Heat stress may become a concern, especially if protective clothing is donned that will decrease natural ventilation. To assist in reducing heat stress the following measures will be taken:

- An adequate supply of water or other liquids will be brought on Site. To prevent dehydration, personnel will be encouraged to drink generous amounts of water even if not thirsty.
- A shady rest area will be designated to provide shelter during sunny days.
- In hot weather, workers wearing protective clothing may be rotated.

When the temperature is over 70 degrees Fahrenheit and personnel are wearing protective clothing, heat stress monitoring may be implemented as follows:

- Heart rate may be measured by counting the radial pulse for 30 seconds at the beginning of the rest period. The heart rate should not exceed 110 beats per minute. If the rate is higher, the next work period will be shortened by ten minutes (or 33%). If the pulse rate is 100 beats per minute at the beginning of the next rest period, the following work cycle will be shortened by 33%. The HSO will decide on the length of work periods and rest periods based on Site conditions.
- Body temperature may be measured, if deemed necessary, at the beginning of the rest period. Oral temperature should not exceed 99 degrees Fahrenheit. If it does, the next work period will be shortened by ten minutes (or 33%). However, if the oral temperature exceeds 99.7 degrees Fahrenheit at the beginning of the next period, the following work cycle will be further shortened by 33%. Work will not re-commence until by temperature has dropped below 99 degrees Fahrenheit.

Indications of heat stress range from mild (fatigue, irritability, anxiety, decreased concentration, dexterity or movement) to fatal. Medical help will be obtained for serious conditions. Heat-related problems are:

- Heat rash: caused by continuous exposure to heat and humid air and aggravated by chafing clothes. Decreases ability to tolerate heat as well as being a nuisance.

- Heat cramps: caused by profuse perspiration with inadequate fluid intake and chemical replacement (especially salts). Signs: muscle spasm and pain in the extremities and abdomen.

- Heat exhaustion: caused by increased stress on various organs to meet increased demands to cool the body. Signs: shallow breathing; pale, cool, moist skin; profuse sweating; dizziness and lassitude.

- Heat stroke: the most severe form of heat stress. Can be fatal. Medical help must be obtained immediately. Body must be cooled immediately to prevent severe injury and/or death. Signs: red, hot, dry skin; no perspiration; nausea; dizziness and confusion; strong, rapid pulse; coma.

Cold exposure is a concern if work is conducted during cold weather or marginally cold weather during precipitation periods or moderate to high wind velocity periods. To assist in reducing cold exposure the following measures will be taken:

- All personnel will be required to wear adequate and appropriate clothing. This will include head gear to prevent the high percentage loss of heat that occurs in this area (thermal liners for hard hats if hard hats are required).

- Provide a readily available warm shelter near each work zone.

- Carefully schedule work and rest periods to account for the current temperature and wind velocity conditions.

- Monitor work patterns and physical condition of workers and rotate personnel, as necessary.

Indications of cold exposure range from shivering, dizziness, numbness, confusion, weakness, impaired judgment, impaired vision to drowsiness. Medical help will be obtained for serious conditions if they occur. Cold exposure-related problems are:

- Frost bite: Ice crystal formation in body tissues. The restricted blood flow to the injured part results in local tissue destruction.

- Hypothermia: Severe exposure to cold temperature resulting in the body losing heat at a rate faster than the body can generate heat. The stages of hypothermia are shivering, apathy, loss of consciousness, decreasing pulse rate and breathing rate and death.

4.2.5 Potential Electrical Hazards

Potential electric hazards consist primarily of underground and overhead power lines. Potential underground electrical hazards will be minimized by having a utility markout performed for both onsite and offsite activities. In addition, available as-built Site blueprints will be used to avoid contact with subsurface utility lines or structures. Overhead electrical hazards will be evaluated by visually observing the work location prior to performing operations which have the potential to contact overhead utilities. No work shall be performed in close proximity to overhead utilities.

4.2.6 The Buddy System

All activities in contaminated or potentially contaminated areas will be conducted by pairing off the Site workers in groups of two (or three if necessary). Each person (buddy) will be able to:

- Provide his or her partner with assistance.
- Observe his or her partner for signs of chemical or heat exposure.
- Periodically check the integrity of his or her partner's protective clothing.
- Notify the HSO or others if emergency help is needed.

The buddy system will be instituted at the beginning of each workday. If new workers arrive on Site, a buddy will be chosen prior to the new worker entering the work zone.

4.2.7 Site Communications

Two sets of communication systems will be established at the Site: internal communication among personnel on-Site, and external communication between on-Site and off-Site personnel.

Internal communication will be used to:

- Alert team members to emergencies.
- Pass along safety information such as heat stress check, protective clothing check, etc.
- Communicate changes in the work to be accomplished.
- Maintain Site control.

Due to ambient noise, verbal communications may be difficult at times. The HSO will carry a whistle (and compressed air horn if respirators are donned) to signal Site workers. A single whistle blast will be the signal to immediately evacuate the work zone through the access control point. This signal will be discussed with all Site workers prior to commencement of work.

An external communication system between on-Site and off-Site personnel will be established to:

- Coordinate emergency response
- Report to the Project Manager
- Maintain contact with essential off-Site personnel

A field telephone will be available at all times in the HSO's vehicle. In addition, the nearest alternate phone will be identified prior to the commencement of Site operations and this location will be relayed to all Site workers.

4.2.8 General Safe Work Practices

Standing orders applicable during Site operations are as follows:

- No smoking, eating, drinking, or application of cosmetics in the work zone.
- No matches or lighters in the work zone.
- All Site workers will enter/exit work zone through the Site access point.
- Any signs of unusual conditions will require reporting the information to the HSO, who will take appropriate action.
- Loose fitting clothing or loose long hair will be prohibited in the work zone during direct push or concrete coring operations.
- A signal person will direct the backing of work vehicles.
- Equipment operators will be instructed to check equipment for abnormalities such as oozing liquids, frayed cables, unusual odors, etc.

SECTION 5.0
PERSONNEL TRAINING REQUIREMENTS

All FPM personnel and contractor personnel will receive adequate training prior to entering the Site. FPM and contractor's personnel will, at a minimum, have completed OSHA-approved, 40-hour hazardous materials Site safety training and OSHA-approved, eight-hour safety refresher course within one year prior to commencing field work. The HSO will have received the OSHA-approved, eight-hour course on managing hazardous waste operations. In addition, each worker must have a minimum of three days field experience under the direct supervision of a trained, experienced supervisor.

Prior to Site fieldwork, the HSO will conduct an in-house review of the project with respect to health and safety with all FPM personnel who will be involved with fieldwork at the Site. The review will include discussions of signs and symptoms of chemical exposure and heat/cold stress that indicate potential medical emergencies presented in Table 5.1. In addition, review of personal protective equipment will be conducted to include the proper use of air-purifying respirators.

Persons receiving the project review/HASP training will sign the HASP acknowledgement form included at the end of this section. The completed form will serve as documentation of the project review/HASP training.

TABLE 5.1
SIGNS AND SYMPTOMS OF EXPOSURE TO CHEMICALS

Type of Hazard	Signs and Symptoms	
Chemical Hazard	Behavioral changes Breathing difficulties Changes in complexion of skin color Confusion Coordination difficulties Coughing Depression Dermatitis Dilated Pupils Dizziness Euphoria Fatigue and/or weakness Flushed face and/or neck Insomnia Irregular heartbeat Irritability	Irritation of eyes, nose, respiratory tract, skin or throat Headache Lacrimation Light-Headedness Muscle Fatigue Nausea Nervousness Numbness in limbs Paresthesia Sleepiness Tingling Tremors Vertigo Visual disturbance Vomiting
Heat Exhaustion	Clammy skin Confusion Dizziness Fainting Fatigue Heat rash	Light-headedness Nausea Profuse sweating Slurred speech Weak pulse
Heat Stroke (may be fatal)	Confusion Convulsions Hot skin, high temperature (yet may feel chilled) Incoherent speech	Staggering gait Sweating stops (yet residual sweat may be present) Unconsciousness

SITE WORKER
HEALTH AND SAFETY TRAINING ACKNOWLEDGMENT

I have read this Health and Safety Plan (HASP) and received training for the Phase II investigation at the 64-02 & 64-06 Queens Boulevard, Woodside, NY Site (the Site) and I have reviewed and understand the potential hazards and the precautions/contingencies of each potential hazard.

I agree to abide by the stipulations of this HASP and further agree to hold FPM Group harmless from, and indemnify against, any accidents which may occur as a result of activities at the Site, regardless of whether or not they were covered in the HASP.

SECTION 6.0
MEDICAL SURVEILLANCE PROGRAM

All workers at the Site must participate in a medical surveillance program in accordance with 29 CFR 1910.120. A medical examination and consultation must have been performed within the last twelve months to be eligible for fieldwork.

The content of the examination and consultation will include a medical and work history with special emphasis on symptoms related to the handling of hazardous substances, health hazards, and fitness for duty including the ability to wear required personal protective equipment under conditions (i.e., temperature extremes) that may be expected at the work Site. All medical examinations and procedures shall be performed by, or under the supervision of, a licensed physician.

The physician shall furnish a written opinion containing:

- The results of the medical examination and tests.
- The physician's opinion as to whether the employee has any detected medical conditions that would place the worker at increased risk of material impairment of the employee's health from work in hazardous waste operations.
- The physician's recommended limitations upon the worker assigned to the work.
- A statement that the worker has been informed by the physician of the results of the medical examination and any further examination or treatment.

An accurate record of the medical surveillance will be retained. The record will consist of at least the following information:

- The name and social security number of the employee.
- Physician's written opinions, recommended limitations, and results of examinations and tests.
- Any worker medical complaints related to exposure to hazardous substances.

SECTION 7.0
PERSONAL PROTECTIVE EQUIPMENT

7.1 General Considerations

The two basic objectives of the personal protective equipment (PPE) are to protect the wearer from safety and health hazards, and to prevent the wearer from incorrect use and/or malfunction of the PPE.

Potential Site hazards were discussed previously in Section 4.0. The duration of Site activities is estimated to be approximately four weeks. All work is expected to be performed during daylight hours and workdays, in general, are expected to be eight hours in duration.

Personal protection levels for the Site activities, based on investigations of nearby properties, are anticipated to be Level D with the unlikely possibility of upgrading to Level C. The equipment included for each level of protection is provided as follows:

Level C Protection

Personnel protective equipment:

- Air-purifying respirator, full-face, equipped with dust and organic vapor cartridges.
- Chemical-resistant clothing includes: Tyvek^{tm} (spunbonded olefin fibers) for particulate and limited splash protection or Saranex^{tm} (plastic film-laminated Tyvek) for permeation resistance to solvents.
- Coveralls*, or
- Long cotton underwear*
- Gloves (outer), chemical-resistant
- Gloves (inner), chemical-resistant
- Boots (outer), leather or chemical-resistant, steel toe and shank.
- Boot covers (outer), chemical-resistant (disposable)*
- Hard hat (face shield)*
- Escape mask*
- 2-way radio communications (intrinsically safe)*

(*) optional

Criteria for Selection of Level C Protection

Meeting all of these criteria permits use of Level C Protection:

- Oxygen concentrations are not less than 19.5% by volume.
- Measured air concentrations of identified substances will be reduced by the respirator below the substance's threshold limit value (TLV).
- Atmospheric contaminants, liquid splashes, or other direct contact will not adversely affect any body area left unprotected by chemical-resistant clothing.
- Job functions do not require self-contained breathing apparatus.
- Direct readings are below 50 ppm on the PID.

Level D Protection

Personnel protective equipment:

- Coveralls
- Gloves*
- Boots/shoes, leather or chemical-resistant, steel toe and shank.
- Safety glasses or chemical splash goggles*
- Hard hat (face shield*)
- Escape mask*

(*) optional

Criteria for Selection of Level D Protection

Meeting any of these criteria allows use of Level D Protection:

- No contaminant levels above 5 ppm organic vapors or dusty conditions are present.
- Work functions preclude splashes, immersion, or the reasonable potential for unexpected inhalation of any chemicals above the TLV.

Additional Considerations for Selecting Levels of Protection

Other factors which will be considered in selecting the appropriate level of protection are heat and physical stress. The use of protective clothing and respirators increases physical stress, in particular, heat stress on the wearer. Chemical protective clothing greatly reduces natural ventilation and diminishes the body's ability to regulate its temperature. Even in moderate ambient temperatures, the diminished capacity of the body to dissipate heat can result in one or more heat-related problems.

All chemical protective garments can be a contributing factor to heat stress. Greater susceptibility to heat stress occurs when protective clothing requires the use of a tightly fitted hood against the respirator face piece, or when gloves or boots are taped to the suit. As more body area is covered, less cooling takes place, increasing the probability of heat stress.

Wearing protective equipment also increases the risk of accidents. It is heavy, cumbersome, decreases dexterity, agility, interferes with vision, and is fatiguing to wear. These factors all increase physical stress and the potential for accidents. In particular, the necessity of selecting a level of protection will be balanced against the increased probability of heat stress and accidents.

7.2 Donning and Doffing Ensembles

Donning an Ensemble

A routine will be established and practiced periodically for donning a Level C ensemble. Assistance may be provided for donning and doffing since these operations are difficult to perform alone. Donning will be completed in the decontamination zone.

Table 7.2.1 lists sample procedures for donning a Level C ensemble. These procedures should be modified depending on the particular type of suit and/or when extra gloves and/or boots are used.

Doffing an Ensemble

Exact procedures for removing Level C ensembles must be established and followed to prevent contaminant migration from the work area and transfer of contaminants to the wearer's body, the doffing assistant, and others. Doffing will be completed in the decontamination zone.

Doffing procedures are provided in Table 7.2.2. These procedures should be performed only after decontamination of the suited worker. They require a suitably attired assistant. Throughout the procedures, both worker and assistant should avoid any direct contact with the outside surface of the suit.

7.3 Respirator Fit Testing

The fit or integrity of the facepiece-to-face seal of a respirator affects its performance. Most facepieces fit only a certain percentage of the population; thus each facepiece must be tested on the potential wearer in order to ensure a tight seal. Facial features such as scars, hollow temples, very prominent cheekbones, deep skin creases, dentures or missing teeth, and the chewing of gum and tobacco may interfere with the respirator-to-face seal. Facial hair in the seal area may also interfere with the respirator-to-face seal and should be removed prior to entry into the work zone. A respirator shall not be worn when such conditions prevent a good seal. The worker's diligence in observing these factors shall be evaluated by periodic checks. Fit testing will comply with 29 CFR 1910.1025 regulations.

TABLE 7.2.1
SAMPLE DONNING PROCEDURES

1. Inspect the clothing and respiratory equipment before donning (see Inspection in subsection 7.4).

2. Adjust hard hat or headpiece if worn, to fit user's head.

3. Standing or sitting, step into the legs of the suit; ensure proper placement of the feet within the suit; then gather the suit around the waist.

4. Put on chemical-resistant safety boots over the feet of the suit. Tape the leg cuff over the tops of the boots.

5. Don the respirator and adjust it to be secure, but comfortable.

6. Perform negative and positive respirator facepiece seal test procedures.

   - To conduct a negative-pressure test, close the inlet part with the palm of the hand or squeeze the breathing tube so it does not pass air, and gently inhale for about 10 seconds. Any inward rushing of air indicates a poor fit. Note that a leaking facepiece may be drawn tightly to the face to form a good seal, giving a false indication of adequate fit.

   - To conduct a positive-pressure test, gently exhale while covering the exhalation valve to ensure that a positive pressure can be built up. Failure to build a positive pressure indicates a poor fit.

7. Depending on type of suit:

   - Put on inner gloves (surgical gloves).

   - Additional overgloves, worn over attached suit gloves, may be donned later.

8. Put on hard hat

9. Have assistant observe the wearer for a period of time to ensure that the wearer is comfortable, psychologically stable, and that the equipment is functioning properly.

TABLE 7.2.2
DOFFING PROCEDURES

1. Remove any extraneous or disposable clothing, boot covers, outer gloves, and tape.

2. Remove respirator by loosening straps and pulling straps over the top of the head and move mask away from head. Do not pull mask over the top of the head.

3. Remove arms, one at a time, from suit, avoiding any contact between the outside surface of the suit and wearer's body and lay the suit out flat behind the wearer. Leave internal gloves on, if any.

4. Sitting, if possible, remove both legs from the suit.

5. After suit is removed, remove internal gloves by rolling them off the hand, inside out.

7.4 Inspection

The PPE inspection program will entail five different inspections:

- Inspection and operational testing of equipment received from the factory or distributor.
- Inspection of equipment as it is issued to workers.
- Inspection after use.
- Periodic inspection of stored equipment.
- Periodic inspection when a question arises concerning the appropriateness of the selected equipment, or when problems with similar equipment arise.

The inspection checklist is provided in Table 7.4.1. Records will be kept of all inspection procedures. Individual identification numbers will be assigned to all reusable pieces of equipment and records should be maintained by that number. At a minimum, each inspection should record the ID number, date, inspector, and any unusual conditions or findings. Periodic review of these records may indicate an item or type of item with excessive maintenance costs or a particularly high level of down-time.

7.5 Storage

Clothing and respirators will be stored properly to prevent damage or malfunction due to exposure to dust, moisture, sunlight, damaging chemicals, extreme temperatures, and impact. Storage procedures are as follows:

TABLE 7.4.1
PPE INSPECTION CHECKLIST

CLOTHING

Before use:

- Determine that the clothing material is correct for the specified task at hand.
- Visually inspect for:
  - imperfect seams
  - non-uniform coatings
  - tears
  - malfunctioning closures
- Hold up to light and check for pinholes.
- Flex product:
  - observe for cracks or other signs of shelf deterioration
- If the product has been used previously, inspect inside and out for signs of chemical attack:
  - discoloration, swelling, stiffness

During the work task, periodically inspect for:

- Evidence of chemical attack such as discoloration, swelling, stiffening, and softening. Keep in mind, however, that chemical permeation can occur without any visible effects.
- Closure failure
- Tears
- Punctures
- Seam discontinuities

GLOVES

Before use:

- Pressurize glove to check for pinholes. Either blow into glove, then roll gauntlet toward fingers or inflate glove and hold under water. In either case, no air should escape.

AIR-PURIFYING RESPIRATORS

- Inspect air-purifying respirators:
  - before each use to be sure they have been adequately cleaned
- Check material conditions for:
  - signs of pliability, deterioration, distortion
- Examine cartridges to ensure that:
  - they are the proper type for the intended use
  - the expiration date has not been passed
  - they have not been opened or used previously
- Check faceshields and lenses for:
  - cracks, crazing, fogginess
- Air purifying respirators will be stored individually in resealable plastic bags.

Clothing:

- Potentially contaminated clothing will be stored in an area separate from street clothing.
- Potentially contaminated clothing will be stored in a well-ventilated area, with good air flow around each item, if possible.
- Different types and material of clothing and gloves will be stored separately to prevent issuing the wrong material by mistake.
- Protective clothing will be folded or hung in accordance with manufacturer's recommendations.

Respirators:

- Air-purifying respirators should be dismantled, washed, and placed in sealed plastic bags.

7.6 Maintenance

Specialized maintenance will be performed only by the factory or an authorized repair person. Routine maintenance, such as cleaning, will be performed by the personnel to whom the equipment is assigned. Respirators will be cleaned at the end of each day with alcohol pads or, preferably, by washing with warm soapy water.

7.7 Decontamination Methods

All personnel, clothing, equipment, and samples leaving the (potentially) contaminated, or work zone, area of the Site must be decontaminated to remove any harmful chemicals or infectious organisms that may have adhered to them. Decontamination methods either (1) physically remove contaminants (2) inactivate contaminants by chemical detoxification or disinfection/sterilization, or (3) remove contaminants by a combination of both physical and chemical means. In many cases, gross contamination can be removed by physical means involving dislodging/displacement, rinsing, wiping off, and evaporation. Contaminants that can be removed by physical means include dust, vapors, and volatile liquids. All reusable equipment will be decontaminated by rinsing in a bath of detergent and water (respirators, gloves to be reused). Monitoring equipment will be decontaminated by wiping with paper towels and water.

The effectiveness of the decontamination will be evaluated near the beginning of Site activities and will be modified if determined to be ineffective. Visual observation will be used for this purpose. The HSO will inspect decontaminated materials for discoloration, stains, corrosive effects, visible dirt, or other signs of possible residual contamination.

All disposable PPE will be discarded following use. All used PPE to be discarded will be placed in an appropriate receptacle for disposal.

SECTION 8.0
DECONTAMINATION PROCEDURES FOR SAMPLING EQUIPMENT

All non-dedicated sampling equipment shall be decontaminated prior to, and following, use at each sampling location. Decontamination procedures shall consist of the following:

1. Scrub equipment in a bath of low-phosphate detergent and potable water.

2. Potable water rinse.

3. Air dry.

4. Aluminum foil wrap, shiny side out, for transport.

Personal protective equipment decontamination has been discussed in Subsection 7.7.

All direct-push equipment and other equipment which has contacted Site soil, groundwater, or soil vapor will be decontaminated prior to leaving the Site. Decontamination of this equipment will consist of physically removing adhering soil using hand tools followed by rinsing the equipment with potable water. Decontamination will be performed in the immediate vicinity of the work area so that the removed soil and rinseate will be discharged in the area from which it originated.

SECTION 9.0
CALIBRATION PROCEDURES, FREQUENCIES, AND MAINTENANCE

This section summarizes the calibration procedures, frequencies, and maintenance for the health and safety field monitoring instruments. The manufacturer's owner's manuals for all monitoring equipment to be used will be present at the Site and will be followed.

The monitoring equipment will include a photoionization detector (PID) which measures the concentration of airborne ionizable gases and vapors. The PID does not distinguish between individual compounds and will not read methane. The PID calibration will be performed using ambient air to "zero" the instrument and a 95 to 100 ppm cylinder of isobutylene to calibrate the span. The calibration will be performed in accordance with the manufacturer's instructions.

Additional monitoring instruments may include a dust monitor, a noise monitor, and other equipment, as necessary. All instruments will be calibrated prior to the commencement of each day's work in accordance with the manufacturer's instructions. The instruments will also be charged overnight prior to each day's work. Maintenance will be performed periodically as needed and in accordance with the manufacturer's instructions.

SECTION 10.0
EMERGENCY RESPONSE PLAN

This section will present the Emergency Response Plan (ERP) for the Site. Pre-emergency planning will consist of reviewing the ERP with all workers at the Site prior to initiation of work.

Personnel Roles

It is anticipated that during sampling activities at the Site several persons, including the HSO and contractor personnel, will be onsite. Should an emergency situation arise at the Site, the HSO will assume control and decision-making. The HSO will also resolve all disputes concerning health and safety requirements and precautions. The HSO will also:

- Be authorized to seek and purchase supplies as necessary.
- Have control over activities of everyone entering the Site.

The HSO will communicate, by field telephone or other, with off-Site personnel to include the Project Manager to evaluate data and assist in the decision-making process. Phone numbers for the fire department, police, ambulance, poison control center, NYS Spills Hotlines, are listed in Table 1.2.1 of this document. The hospital which will be utilized during an emergency will be Elmhurst Hospital Center in Elmhurst. The directions to the hospital, along with the hospital's emergency room phone number are presented in Table 1.2.1. Copies of Table 1.2.1 will be available at the Site and will be placed in all vehicles of personnel involved in activities at the Site.

Internal communications will consist of a single whistle (or compressed air horn if Level C is donned) blast. This blast will signal all workers to evacuate the work zone by the nearest exit.

Response Follow-Up

Following an emergency, or incident, a detailed report will be generated by the HSO. All equipment will be restored to pre-emergency conditions. The HASP will be reviewed following an emergency to determine if it provides adequate information to assist in dealing with the emergency. The HASP may be revised to incorporate additional information as needed.

Emergency Recognition and Prevention

Before daily work assignments begin, each day a brief on-Site meeting will be held by the HSO which will address health and safety issues related to the day's work. Prior to initiation of work, a detailed on-Site health and safety meeting will be held to review all potential hazards, contingencies, and safety measures.

Safe Distances and Places of Refuge

The main potential cause of work zone evacuation is a significant vapor release. Vapor release evacuation will be discussed prior to subsurface activities at the Site and in general will be in the upwind direction. Wind direction will be monitored at each work location and all workers will be notified of the direction of evacuation prior to commencement of work. Safe distances will be discussed at each location and determined by the HSO. The PID will be used to determine if workers have evacuated a

sufficient distance.

At all times, vehicles which may be utilized in an emergency for transport to the hospital (or other destination) will have clear access to leave the Site. The HSO will assure that an emergency vehicle does not become blocked-in by other vehicles.

Site Security and Control

The HSO will control entry of personnel into the work zone. No unnecessary persons shall be permitted in the work zone.

Decontamination Procedures During Emergencies

In the event of a medical emergency, decontamination will be performed if it does not interfere with essential treatment. Decontamination will be performed by washing, rinsing, and/or cutting off protective clothing and equipment.

If decontamination cannot be performed, the victim will be wrapped in plastic to reduce contamination to other personnel. Emergency and off-Site medical personnel will be alerted to the potential contamination.

Emergency Medical Treatment and First Aid

Medical emergencies will be treated, in general, by medical experts by transporting the victim to the nearby hospital. A first aid kit will be present on Site for minor medical treatment.

Section 3: Hazards Identification

Potential Acute Health Effects:
Hazardous in case of skin contact (irritant), of eye contact (irritant), of ingestion, of inhalation. Slightly hazardous in case of skin contact (permeator).

Potential Chronic Health Effects:
CARCINOGENIC EFFECTS: A4 (Not classifiable for human or animal.) by ACGIH. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Classified Reproductive system/toxin/female, Reproductive system/toxin/male [SUSPECTED]. The substance is toxic to central nervous system (CNS). The substance may be toxic to kidneys, the reproductive system, liver, skin. Repeated or prolonged exposure to the substance can produce target organs damage.

Section 4: First Aid Measures

Eye Contact:
Check for and remove any contact lenses. Immediately flush eyes with running water for at least 15 minutes, keeping eyelids open. Cold water may be used. Get medical attention.

Skin Contact:
In case of contact, immediately flush skin with plenty of water. Cover the irritated skin with an emollient. Remove contaminated clothing and shoes. Cold water may be used.Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention.

Serious Skin Contact:
Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek medical attention.

Inhalation:
If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention if symptoms appear.

Serious Inhalation:
Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. Seek medical attention.

Ingestion:
Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. Loosen tight clothing such as a collar, tie, belt or waistband. Get medical attention if symptoms appear.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Flammable.

Auto-Ignition Temperature: 465°C (869°F)

Flash Points: CLOSED CUP: -20°C (-4°F). OPEN CUP: -9°C (15.8°F) (Cleveland).

Flammable Limits: LOWER: 2.6% UPPER: 12.8%

Products of Combustion: These products are carbon oxides (CO, CO2).

Fire Hazards in Presence of Various Substances: Highly flammable in presence of open flames and sparks, of heat.

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available. Slightly explosive in presence of open flames and sparks, of oxidizing materials, of acids.

Fire Fighting Media and Instructions:
Flammable liquid, soluble or dispersed in water. SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use alcohol foam, water spray or fog.

Special Remarks on Fire Hazards: Vapor may travel considerable distance to source of ignition and flash back.

Special Remarks on Explosion Hazards:
Forms explosive mixtures with hydrogen peroxide, acetic acid, nitric acid, nitric acid + sulfuric acid, chromic anydride, chromyl chloride, nitrosyl chloride, hexachloromelamine, nitrosyl perchlorate, nitryl perchlorate, permonosulfuric acid, thiodiglycol + hydrogen peroxide, potassium ter-butoxide, sulfur dichloride, 1-methyl-1,3-butadiene, bromoform, carbon, air, chloroform, thitriazylperchlorate.

Section 6: Accidental Release Measures

Small Spill:
Dilute with water and mop up, or absorb with an inert dry material and place in an appropriate waste disposal container.

Large Spill:
Flammable liquid. Keep away from heat. Keep away from sources of ignition. Stop leak if without risk. Absorb with DRY earth, sand or other non-combustible material. Do not touch spilled material. Prevent entry into sewers, basements or confined areas; dike if needed. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep locked up.. Keep away from heat. Keep away from sources of ignition. Ground all equipment containing material. Do not ingest. Do not breathe gas/fumes/ vapor/spray. Wear suitable protective clothing. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes. Keep away from incompatibles such as oxidizing agents, reducing agents, acids, alkalis.

Storage:
Store in a segregated and approved area (flammables area) . Keep container in a cool, well-ventilated area. Keep container tightly closed and sealed until ready for use. Keep away from direct sunlight and heat and avoid all possible sources of ignition (spark or flame).

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.

Personal Protection:
Splash goggles. Lab coat. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Vapor respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
TWA: 500 STEL: 750 (ppm) from ACGIH (TLV) [United States] TWA: 750 STEL: 1000 (ppm) from OSHA (PEL) [United States] TWA: 500 STEL: 1000 [Austalia] TWA: 1185 STEL: 2375 (mg/m3) [Australia] TWA: 750 STEL: 1500 (ppm) [United Kingdom (UK)] TWA: 1810 STEL: 3620 (mg/m3) [United Kingdom (UK)] TWA: 1800 STEL: 2400 from OSHA (PEL) [United States]Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Liquid.

Odor: Fruity. Mint-like. Fragrant. Ethereal

Taste: Pungent, Sweetish

Molecular Weight: 58.08 g/mole

Color: Colorless. Clear

pH (1% soln/water): Not available.

Boiling Point: 56.2°C (133.2°F)

Melting Point: -95.35 (-139.6°F)

Critical Temperature: 235°C (455°F)

Specific Gravity: 0.79 (Water = 1)

Vapor Pressure: 24 kPa (@ 20°C)

Vapor Density: 2 (Air = 1)

Volatility: Not available.

Odor Threshold: 62 ppm

Water/Oil Dist. Coeff.: The product is more soluble in water; log(oil/water) = -0.2

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water.

Solubility: Easily soluble in cold water, hot water.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Excess heat, ignition sources, exposure to moisture, air, or water, incompatible materials.

Incompatibility with various substances: Reactive with oxidizing agents, reducing agents, acids, alkalis.

Corrosivity: Non-corrosive in presence of glass.

Special Remarks on Reactivity: Not available.

Special Remarks on Corrosivity: Not available.

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation.

Toxicity to Animals:
WARNING: THE LC50 VALUES HEREUNDER ARE ESTIMATED ON THE BASIS OF A 4-HOUR EXPOSURE. Acute oral toxicity (LD50): 3000 mg/kg [Mouse]. Acute toxicity of the vapor (LC50): 44000 mg/m3 4 hours [Mouse].

Chronic Effects on Humans:
CARCINOGENIC EFFECTS: A4 (Not classifiable for human or animal.) by ACGIH. DEVELOPMENTAL TOXICITY: Classified Reproductive system/toxin/female, Reproductive system/toxin/male [SUSPECTED]. Causes damage to the following organs: central nervous system (CNS). May cause damage to the following organs: kidneys, the reproductive system, liver, skin.

Other Toxic Effects on Humans:
Hazardous in case of skin contact (irritant), of ingestion, of inhalation. Slightly hazardous in case of skin contact (permeator).

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans:
May affect genetic material (mutagenicity) based on studies with yeast (S. cerevisiae), bacteria, and hamster fibroblast cells. May cause reproductive effects (fertility) based upon animal studies. May contain trace amounts of benzene and formaldehyde which may cancer and birth defects. Human: passes the placental barrier.

Special Remarks on other Toxic Effects on Humans:
Acute Potential Health Effects: Skin: May cause skin irritation. May be harmful if absorbed through the skin. Eyes: Causes eye irritation, characterized by a burning sensation, redness, tearing, inflammation, and possible corneal injury. Inhalation: Inhalation at high concentrations affects the sense organs, brain and causes respiratory tract irritation. It also may affect the Central Nervous System (behavior) characterized by dizzness, drowsiness, confusion, headache, muscle weakeness, and possibly motor incoordination, speech abnormalities, narcotic effects and coma. Inhalation may also affect the gastrointestinal tract (nausea, vomiting). Ingestion: May cause irritation of the digestive (gastrointestinal) tract (nausea, vomiting). It may also

affect the Central Nevous System (behavior), characterized by depression, fatigue, excitement, stupor, coma, headache, altered sleep time, ataxia, tremors as well at the blood, liver, and urinary system (kidney, bladder, ureter) and endocrine system. May also have musculoskeletal effects. Chronic Potential Health Effects: Skin: May cause dermatitis. Eyes: Eye irritation.

Section 12: Ecological Information

Ecotoxicity:
Ecotoxicity in water (LC50): 5540 mg/l 96 hours [Trout]. 8300 mg/l 96 hours [Bluegill]. 7500 mg/l 96 hours [Fatthead Minnow]. 0.1 ppm any hours [Water flea].

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The product itself and its products of degradation are not toxic.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:
Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: CLASS 3: Flammable liquid.

Identification: : Acetone UNNA: 1090 PG: II

Special Provisions for Transport: Not available.

Section 15: Other Regulatory Information

Federal and State Regulations:
California prop. 65: This product contains the following ingredients for which the State of California has found to cause reproductive harm (male) which would require a warning under the statute: Benzene California prop. 65: This product contains the following ingredients for which the State of California has found to cause birth defects which would require a warning under the statute: Benzene California prop. 65: This product contains the following ingredients for which the State of California has found to cause cancer which would require a warning under the statute: Benzene, Formaldehyde Connecticut hazardous material survey.: Acetone Illinois toxic substances disclosure to employee act: Acetone Illinois chemical safety act: Acetone New York release reporting list: Acetone Rhode Island RTK hazardous substances: Acetone Pennsylvania RTK: Acetone Florida: Acetone Minnesota: Acetone Massachusetts RTK: Acetone Massachusetts spill list: Acetone New Jersey: Acetone New Jersey spill list: Acetone Louisiana spill reporting: Acetone California List of Hazardous Substances (8 CCR 339): Acetone TSCA 8(b) inventory: Acetone TSCA 4(a) final test rules: Acetone TSCA 8(a) IUR: Acetone

Other Regulations:
OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200). EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada):
CLASS B-2: Flammable liquid with a flash point lower than 37.8°C (100°F). CLASS D-2B: Material causing other toxic effects (TOXIC).

DSCL (EEC):
R11- Highly flammable. R36- Irritating to eyes. S9- Keep container in a well-ventilated place. S16- Keep away from sources of ignition - No smoking. S26- In case of contact with eyes, rinse immediately with plenty of water and seek medical advice.

HMIS (U.S.A.):

Health Hazard: 2

Fire Hazard: 3

Reactivity: 0

Personal Protection: h

National Fire Protection Association (U.S.A.):

Health: 1

Flammability: 3

Reactivity: 0

Specific hazard:

Protective Equipment:
Gloves. Lab coat. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Wear appropriate respirator when ventilation is inadequate. Splash goggles.

Material Safety Data Sheet
Cadmium MSDS

Section 1: Chemical Product and Company Identification

Product Name: Cadmium

Catalog Codes: SLC3484, SLC5272, SLC2482

CAS#: 7440-43-9

RTECS: EU9800000

TSCA: TSCA 8(b) inventory: Cadmium

CI#: Not applicable.

Synonym:

Chemical Name: Cadmium

Chemical Formula: Cd

Contact Information:

Sciencelab.com, Inc.
14025 Smith Rd.
Houston, Texas 77396

US Sales: **1-800-901-7247**
International Sales: **1-281-441-4400**

Order Online: ScienceLab.com

CHEMTREC (24HR Emergency Telephone), call: 1-800-424-9300

International CHEMTREC, call: 1-703-527-3887

For non-emergency assistance, call: 1-281-441-4400

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Cadmium	7440-43-9	100

Toxicological Data on Ingredients: Cadmium: ORAL (LD50): Acute: 2330 mg/kg [Rat.]. 890 mg/kg [Mouse]. DUST (LC50): Acute: 50 ppm 4 hour(s) [Rat].

Section 3: Hazards Identification

Potential Acute Health Effects:
Hazardous in case of ingestion, of inhalation. Slightly hazardous in case of skin contact (irritant, sensitizer), of eye contact (irritant). Severe over-exposure can result in death.

Potential Chronic Health Effects:
CARCINOGENIC EFFECTS: Classified A2 (Suspected for human.) by ACGIH, 2 (Reasonably anticipated.) by NTP. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Not available. The substance is toxic to kidneys, lungs, liver. Repeated or prolonged exposure to the substance can produce target organs damage. Repeated exposure to an highly toxic material may produce general deterioration of health by an accumulation in one or many human organs.

Section 4: First Aid Measures

Eye Contact: No known effect on eye contact, rinse with water for a few minutes.

Skin Contact:
After contact with skin, wash immediately with plenty of water. Gently and thoroughly wash the contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases and groin. Cover the irritated skin with an emollient. If irritation persists, seek medical attention. Wash contaminated clothing before reusing.

Serious Skin Contact: Not available.

Inhalation: Allow the victim to rest in a well ventilated area. Seek immediate medical attention.

Serious Inhalation:
Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. WARNING: It may be hazardous to the person providing aid to give mouth-to-mouth resuscitation when the inhaled material is toxic, infectious or corrosive. Seek immediate medical attention.

Ingestion:
Do not induce vomiting. Examine the lips and mouth to ascertain whether the tissues are damaged, a possible indication that the toxic material was ingested; the absence of such signs, however, is not conclusive. Loosen tight clothing such as a collar, tie, belt or waistband. If the victim is not breathing, perform mouth-to-mouth resuscitation. Seek immediate medical attention.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: May be combustible at high temperature.

Auto-Ignition Temperature: 570°C (1058°F)

Flash Points: Not available.

Flammable Limits: Not available.

Products of Combustion: Some metallic oxides.

Fire Hazards in Presence of Various Substances:
Non-flammable in presence of open flames and sparks, of heat, of oxidizing materials, of reducing materials, of combustible materials, of moisture.

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available.

Fire Fighting Media and Instructions:
SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use water spray, fog or foam. Do not use water jet.

Special Remarks on Fire Hazards:
Material in powder form, capable of creating a dust explosion. When heated to decomposition it emits toxic fumes.

Special Remarks on Explosion Hazards: Not available.

Section 6: Accidental Release Measures

Small Spill: Use appropriate tools to put the spilled solid in a convenient waste disposal container.

Large Spill:
Use a shovel to put the material into a convenient waste disposal container. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep locked up Keep away from heat. Keep away from sources of ignition. Empty containers pose a fire risk, evaporate the residue under a fume hood. Ground all equipment containing material. Do not ingest. Do not breathe dust. Wear suitable protective clothing In case of insufficient ventilation, wear suitable respiratory equipment If ingested, seek medical advice immediately and show the container or the label. Keep away from incompatibles such as oxidizing agents.

Storage:
Keep container dry. Keep in a cool place. Ground all equipment containing material. Keep container tightly closed. Keep in a cool, well-ventilated place. Highly toxic or infectious materials should be stored in a separate locked safety storage cabinet or room.

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If user operations generate dust, fume or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit.

Personal Protection: Safety glasses. Lab coat. Dust respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Dust respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
TWA: 0.01 (ppm) Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Solid. (Lustrous solid.)

Odor: Not available.

Taste: Not available.

Molecular Weight: 112.4 g/mole

Color: Silvery.

pH (1% soln/water): Not applicable.

Boiling Point: 765°C (1409°F)

Melting Point: 320.9°C (609.6°F)

Critical Temperature: Not available.

Specific Gravity: 8.64 (Water = 1)

Vapor Pressure: Not applicable.

Vapor Density: Not available.

Volatility: Not available.

Odor Threshold: Not available.

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties: Not available.

Solubility: Insoluble in cold water, hot water, methanol, diethyl ether, n-octanol.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Not available.

Incompatibility with various substances: Reactive with oxidizing agents.

Corrosivity: Not considered to be corrosive for metals and glass.

Special Remarks on Reactivity: Reacts violently with potassium.

Special Remarks on Corrosivity: Not available.

Polymerization: No.

Section 11: Toxicological Information

Routes of Entry: Inhalation. Ingestion.

Toxicity to Animals:
WARNING: THE LC50 VALUES HEREUNDER ARE ESTIMATED ON THE BASIS OF A 4-HOUR EXPOSURE. Acute oral toxicity (LD50): 890 mg/kg [Mouse]. Acute toxicity of the dust (LC50): 229.9 mg/m3 4 hour(s) [Rat].

Chronic Effects on Humans:
CARCINOGENIC EFFECTS: Classified A2 (Suspected for human.) by ACGIH, 2 (Reasonably anticipated.) by NTP. The substance is toxic to kidneys, lungs, liver.

Other Toxic Effects on Humans:
Hazardous in case of ingestion, of inhalation. Slightly hazardous in case of skin contact (irritant, sensitizer).

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans: An allergen. 0047 Animal: embryotoxic, passes through the placental barrier.

Special Remarks on other Toxic Effects on Humans: May cause allergic reactions, exzema and/or dehydration of the skin.

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are as toxic as the original product.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:

Section 14: Transport Information

DOT Classification:

Identification:

Special Provisions for Transport:

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Copper	7440-50-8	100

Toxicological Data on Ingredients: Copper LD50: Not available. LC50: Not available.

Section 3: Hazards Identification

Potential Acute Health Effects:
Very hazardous in case of ingestion. Hazardous in case of eye contact (irritant), of inhalation. Slightly hazardous in case of skin contact (irritant).

Potential Chronic Health Effects:
CARCINOGENIC EFFECTS: Not available. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Not available. The substance is toxic to lungs, mucous membranes. Repeated or prolonged exposure to the substance can produce target organs damage.

Section 4: First Aid Measures

Eye Contact: Check for and remove any contact lenses. Do not use an eye ointment. Seek medical attention.

Skin Contact:
After contact with skin, wash immediately with plenty of water. Gently and thoroughly wash the contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases and groin. Cover the irritated skin with an emollient. If irritation persists, seek medical attention. Wash contaminated clothing before reusing.

Serious Skin Contact: Not available.

Inhalation: Allow the victim to rest in a well ventilated area. Seek immediate medical attention.

Serious Inhalation: Not available.

Ingestion:
Do not induce vomiting. Loosen tight clothing such as a collar, tie, belt or waistband. If the victim is not breathing, perform mouth-to-mouth resuscitation. Seek immediate medical attention.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: May be combustible at high temperature.

Auto-Ignition Temperature: Not available.

Flash Points: Not available.

Flammable Limits: Not available.

Products of Combustion: Some metallic oxides.

Fire Hazards in Presence of Various Substances: Not available.

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available.

Fire Fighting Media and Instructions:
SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use water spray, fog or foam. Do not use water jet.

Special Remarks on Fire Hazards: Not available.

Special Remarks on Explosion Hazards: Not available.

Section 6: Accidental Release Measures

Small Spill:
Use appropriate tools to put the spilled solid in a convenient waste disposal container. Finish cleaning by spreading water on the contaminated surface and dispose of according to local and regional authority requirements.

Large Spill:
Use a shovel to put the material into a convenient waste disposal container. Finish cleaning by spreading water on the contaminated surface and allow to evacuate through the sanitary system. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep away from heat. Keep away from sources of ignition. Empty containers pose a fire risk, evaporate the residue under a fume hood. Ground all equipment containing material. Do not breathe dust. Avoid contact with eyes Wear suitable protective clothing In case of insufficient ventilation, wear suitable respiratory equipment If you feel unwell, seek medical attention and show the label when possible.

Storage:
Keep container dry. Keep in a cool place. Ground all equipment containing material. Keep container tightly closed. Keep in a cool, well-ventilated place. Combustible materials should be stored away from extreme heat and away from strong oxidizing agents.

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If user operations generate dust, fume or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit.

Personal Protection:
Splash goggles. Lab coat. Dust respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Dust respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
TWA: 1 (mg/m3) from ACGIH [1990] Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Solid.

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Not available.

Incompatibility with various substances: Not available.

Corrosivity: Non-corrosive in presence of glass.

Special Remarks on Reactivity: Not available.

Special Remarks on Corrosivity: Not available.

Polymerization: No.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Eye contact. Inhalation. Ingestion.

Toxicity to Animals:
LD50: Not available. LC50: Not available.

Chronic Effects on Humans: The substance is toxic to lungs, mucous membranes.

Other Toxic Effects on Humans:
Very hazardous in case of ingestion. Hazardous in case of inhalation. Slightly hazardous in case of skin contact (irritant).

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans: Human: passes through the placenta, excreted in maternal milk.

Special Remarks on other Toxic Effects on Humans: Not available.

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are as toxic as the original product.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:

Section 14: Transport Information

DOT Classification: Not a DOT controlled material (United States).

Identification: Not applicable.

Special Provisions for Transport: Marine Pollutant

Section 15: Other Regulatory Information

Federal and State Regulations:
Pennsylvania RTK: Copper Massachusetts RTK: Copper TSCA 8(b) inventory: Copper CERCLA: Hazardous substances.: Copper

Other Regulations: OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200).

Other Classifications:

WHMIS (Canada): CLASS D-2A: Material causing other toxic effects (VERY TOXIC).

DSCL (EEC): R36- Irritating to eyes.

HMIS (U.S.A.):

Health Hazard: 2

Fire Hazard: 1

Reactivity: 0

Personal Protection: E

National Fire Protection Association (U.S.A.):

Health: 2

Flammability: 1

Reactivity: 0

Specific hazard:

Protective Equipment:
Gloves. Lab coat. Dust respirator. Be sure to use an approved/certified respirator or equivalent. Wear appropriate respirator when ventilation is inadequate. Splash goggles.

Section 16: Other Information

References: Not available.

Other Special Considerations: Not available.

MATERIAL SAFETY DATA SHEET

Gasoline, All Grades **MSDS No. 9950**

EMERGENCY OVERVIEW

DANGER!

EXTREMELY FLAMMABLE - EYE AND MUCOUS MEMBRANE IRRITANT - EFFECTS CENTRAL NERVOUS SYSTEM - HARMFUL OR FATAL IF SWALLOWED - ASPIRATION HAZARD

NFPA 704 (Section 16)

High fire hazard. Keep away from heat, spark, open flame, and other ignition sources.

If ingested, do NOT induce vomiting, as this may cause chemical pneumonia (fluid in the lungs). Contact may cause eye, skin and mucous membrane irritation. Harmful if absorbed through the skin. Avoid prolonged breathing of vapors or mists. Inhalation may cause irritation, anesthetic effects (dizziness, nausea, headache, intoxication), and respiratory system effects.

Long-term exposure may cause effects to specific organs, such as to the liver, kidneys, blood, nervous system, and skin. Contains benzene, which can cause blood disease, including anemia and leukemia.

1. CHEMICAL PRODUCT and COMPANY INFORMATION

Hess Corporation
1 Hess Plaza
Woodbridge, NJ 07095-0961

EMERGENCY TELEPHONE NUMBER (24 hrs): **CHEMTREC (800)424-9300**
COMPANY CONTACT (business hours): Corporate Safety (732)750-6000
MSDS (Environment, Health, Safety) Internet Website www.hess.com

SYNONYMS: Hess Conventional (Oxygenated and Non-oxygenated) Gasoline; Reformulated Gasoline (RFG); Reformulated Gasoline Blendstock for Oxygenate Blending (RBOB); Unleaded Motor or Automotive Gasoline

See Section 16 for abbreviations and acronyms.

2. COMPOSITION and INFORMATION ON INGREDIENTS *

INGREDIENT NAME (CAS No.)	CONCENTRATION PERCENT BY WEIGHT
Gasoline (86290-81-5)	100
Benzene (71-43-2)	0.1 - 4.9 (0.1 - 1.3 reformulated gasoline)
n-Butane (106-97-8)	< 10
Ethyl Alcohol (Ethanol) (64-17-5)	0 - 10
Ethyl benzene (100-41-4)	< 3
n-Hexane (110-54-3)	0.5 to 4
Methyl-tertiary butyl ether (MTBE) (1634-04-4)	0 to 15.0
Tertiary-amyl methyl ether (TAME) (994-05-8)	0 to 17.2
Toluene (108-88-3)	1 - 25
1,2,4- Trimethylbenzene (95-63-6)	< 6
Xylene, mixed isomers (1330-20-7)	1 - 15

A complex blend of petroleum-derived normal and branched-chain alkane, cycloalkane, alkene, and aromatic hydrocarbons. May contain antioxidant and multifunctional additives. Non-oxygenated Conventional Gasoline and RBOB do not have oxygenates (Ethanol or MTBE and/or TAME).

Oxygenated Conventional and Reformulated Gasoline will have oxygenates for octane enhancement or as legally required.

3. HAZARDS IDENTIFICATION

EYES
Moderate irritant. Contact with liquid or vapor may cause irritation.

SKIN
Practically non-toxic if absorbed following acute (single) exposure. May cause skin irritation with prolonged or repeated contact. Liquid may be absorbed through the skin in toxic amounts if large areas of skin are exposed repeatedly.

INGESTION
The major health threat of ingestion occurs from the danger of aspiration (breathing) of liquid drops into the lungs, particularly from vomiting. Aspiration may result in chemical pneumonia (fluid in the lungs), severe lung damage, respiratory failure and even death.

Ingestion may cause gastrointestinal disturbances, including irritation, nausea, vomiting and diarrhea, and central nervous system (brain) effects similar to alcohol intoxication. In severe cases, tremors, convulsions, loss of consciousness, coma, respiratory arrest, and death may occur.

INHALATION
Excessive exposure may cause irritations to the nose, throat, lungs and respiratory tract. Central nervous system (brain) effects may include headache, dizziness, loss of balance and coordination, unconsciousness, coma, respiratory failure, and death.

WARNING: the burning of any hydrocarbon as a fuel in an area without adequate ventilation may result in hazardous levels of combustion products, including carbon monoxide, and inadequate oxygen levels, which may cause unconsciousness, suffocation, and death.

CHRONIC EFFECTS and CARCINOGENICITY
Contains benzene, a regulated human carcinogen. Benzene has the potential to cause anemia and other blood diseases, including leukemia, after repeated and prolonged exposure. Exposure to light hydrocarbons in the same boiling range as this product has been associated in animal studies with systemic toxicity. See also Section 11 - Toxicological Information.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE
Irritation from skin exposure may aggravate existing open wounds, skin disorders, and dermatitis (rash). Chronic respiratory disease, liver or kidney dysfunction, or pre-existing central nervous system disorders may be aggravated by exposure.

4. FIRST AID MEASURES

EYES
In case of contact with eyes, immediately flush with clean, low-pressure water for at least 15 min. Hold eyelids open to ensure adequate flushing. Seek medical attention.

SKIN
Remove contaminated clothing. Wash contaminated areas thoroughly with soap and water or waterless hand cleanser. Obtain medical attention if irritation or redness develops.

INGESTION

DO NOT INDUCE VOMITING. Do not give liquids. Obtain immediate medical attention. If spontaneous vomiting occurs, lean victim forward to reduce the risk of aspiration. Small amounts of material which enter the mouth should be rinsed out until the taste is dissipated.

INHALATION

Remove person to fresh air. If person is not breathing, ensure an open airway and provide artificial respiration. If necessary, provide additional oxygen once breathing is restored if trained to do so. Seek medical attention immediately.

5. FIRE FIGHTING MEASURES

FLAMMABLE PROPERTIES:

FLASH POINT:	-45 °F (-43°C)
AUTOIGNITION TEMPERATURE:	highly variable; > 530 °F (>280 °C)
OSHA/NFPA FLAMMABILITY CLASS:	1A (flammable liquid)
LOWER EXPLOSIVE LIMIT (%):	1.4%
UPPER EXPLOSIVE LIMIT (%):	7.6%

FIRE AND EXPLOSION HAZARDS

Vapors may be ignited rapidly when exposed to heat, spark, open flame or other source of ignition. Flowing product may be ignited by self-generated static electricity. When mixed with air and exposed to an ignition source, flammable vapors can burn in the open or explode in confined spaces. Being heavier than air, vapors may travel long distances to an ignition source and flash back. Runoff to sewer may cause fire or explosion hazard.

EXTINGUISHING MEDIA

SMALL FIRES: Any extinguisher suitable for Class B fires, dry chemical, CO2, water spray, fire fighting foam, or Halon.

LARGE FIRES: Water spray, fog or fire fighting foam. Water may be ineffective for fighting the fire, but may be used to cool fire-exposed containers.

During certain times of the year and/or in certain geographical locations, gasoline may contain MTBE and/or TAME. Firefighting foam suitable for polar solvents is recommended for fuel with greater than 10% oxygenate concentration - refer to NFPA 11 "Low Expansion Foam - 1994 Edition."

FIRE FIGHTING INSTRUCTIONS

Small fires in the incipient (beginning) stage may typically be extinguished using handheld portable fire extinguishers and other fire fighting equipment.

Firefighting activities that may result in potential exposure to high heat, smoke or toxic by-products of combustion should require NIOSH/MSHA- approved pressure-demand self-contained breathing apparatus with full facepiece and full protective clothing.

Isolate area around container involved in fire. Cool tanks, shells, and containers exposed to fire and excessive heat with water. For massive fires the use of unmanned hose holders or monitor nozzles may be advantageous to further minimize personnel exposure. Major fires may require withdrawal, allowing the tank to burn. Large storage tank fires typically require specially trained personnel and equipment to extinguish the fire, often including the need for properly applied fire fighting foam.

See Section 16 for the NFPA 704 Hazard Rating.

6. ACCIDENTAL RELEASE MEASURES

ACTIVATE FACILITY SPILL CONTINGENCY or EMERGENCY PLAN.

Evacuate nonessential personnel and remove or secure all ignition sources. Consider wind direction; stay upwind and uphill, if possible. Evaluate the direction of product travel, diking, sewers, etc. to confirm spill areas. Spills may infiltrate subsurface soil and groundwater; professional assistance may be necessary to determine the extent of subsurface impact.

Carefully contain and stop the source of the spill, if safe to do so. Protect bodies of water by diking, absorbents, or absorbent boom, if possible. Do not flush down sewer or drainage systems, unless system is designed and permitted to handle such material. The use of fire fighting foam may be useful in certain situations to reduce vapors. The proper use of water spray may effectively disperse product vapors or the liquid itself, preventing contact with ignition sources or areas/equipment that require protection.

Take up with sand or other oil absorbing materials. Carefully shovel, scoop or sweep up into a waste container for reclamation or disposal - caution, flammable vapors may accumulate in closed containers. Response and clean-up crews must be properly trained and must utilize proper protective equipment (see Section 8).

7. HANDLING and STORAGE

HANDLING PRECAUTIONS

******USE ONLY AS A MOTOR FUEL******
******DO NOT SIPHON BY MOUTH******

Handle as a flammable liquid. Keep away from heat, sparks, and open flame! Electrical equipment should be approved for classified area. Bond and ground containers during product transfer to reduce the possibility of static-initiated fire or explosion.

Special slow load procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when higher flash point material (such as fuel oil) is loaded into tanks previously containing low flash point products (such as this product) - see API Publication 2003, "Protection Against Ignitions Arising Out Of Static, Lightning and Stray Currents.

STORAGE PRECAUTIONS

Keep away from flame, sparks, excessive temperatures and open flame. Use approved vented containers. Keep containers closed and clearly labeled. Empty product containers or vessels may contain explosive vapors. Do not pressurize, cut, heat, weld or expose such containers to sources of ignition.

Store in a well-ventilated area. This storage area should comply with NFPA 30 "Flammable and Combustible Liquid Code". Avoid storage near incompatible materials. The cleaning of tanks previously containing this product should follow API Recommended Practice (RP) 2013 "Cleaning Mobile Tanks In Flammable and Combustible Liquid Service" and API RP 2015 "Cleaning Petroleum Storage Tanks".

WORK/HYGIENIC PRACTICES

Emergency eye wash capability should be available in the near proximity to operations presenting a potential splash exposure. Use good personal hygiene practices. Avoid repeated and/or prolonged skin exposure. Wash hands before eating, drinking, smoking, or using toilet facilities. Do not use as a cleaning solvent on the skin. Do not use solvents or harsh abrasive skin cleaners for washing this product from exposed skin areas. Waterless hand cleaners are effective. Promptly remove contaminated clothing and launder before reuse. Use care when laundering to prevent the formation of flammable vapors which could ignite via washer or dryer. Consider the need to discard contaminated leather shoes and gloves.

8. EXPOSURE CONTROLS and PERSONAL PROTECTION

EXPOSURE LIMITS

Component (CAS No.)	Exposure Limits			
	Source	TWA (ppm)	STEL (ppm)	Note
Gasoline (86290-81-5)	ACGIH	300	500	A3
Benzene (71-43-2)	OSHA	1	5	Carcinogen
	ACGIH	0.5	2.5	A1, skin
	USCG	1	5	
n-Butane (106-97-8)	ACGIH	1000	--	Aliphatic Hydrocarbon Gases Alkane (C1-C4)
Ethyl Alcohol (ethanol) (64-17-5)	OSHA	1000	--	
	ACGIH	1000	--	A4
Ethyl benzene (100-41-4)	OSHA	100	--	
	ACGIH	100	125	A3
n-Hexane (110-54-3)	OSHA	500	--	
	ACGIH	50	--	Skin
Methyl-tertiary butyl ether [MTBE] (1634-04-4)	ACGIH	50		A3
Tertiary-amyl methyl ether [TAME] (994-05-8)				None established
Toluene (108-88-3)	OSHA	200		Ceiling: 300 ppm; Peak: 500 ppm (10 min.)
	ACGIH	20	--	A4
1,2,4- Trimethylbenzene (95-63-6)	ACGIH	25	--	
Xylene, mixed isomers (1330-20-7)	OSHA	100	--	
	ACGIH	100	150	A4

ENGINEERING CONTROLS

Use adequate ventilation to keep vapor concentrations of this product below occupational exposure and flammability limits, particularly in confined spaces.

EYE/FACE PROTECTION

Safety glasses or goggles are recommended where there is a possibility of splashing or spraying.

SKIN PROTECTION

Gloves constructed of nitrile or neoprene are recommended. Chemical protective clothing such as that made of of E.I. DuPont Tychem ®, products or equivalent is recommended based on degree of exposure.

Note: The resistance of specific material may vary from product to product as well as with degree of exposure. Consult manufacturer specifications for further information.

RESPIRATORY PROTECTION

A NIOSH-approved air-purifying respirator with organic vapor cartridges or canister may be permissible under certain circumstances where airborne concentrations are or may be expected to exceed exposure limits or for odor or irritation. Protection provided by air-purifying respirators is limited. Refer to OSHA 29 CFR 1910.134, NIOSH Respirator Decision Logic, and the manufacturer for additional guidance on respiratory protection selection and limitations.

Use a positive pressure, air-supplied respirator if there is a potential for uncontrolled release, exposure levels are not known, in oxygen-deficient atmospheres, or any other circumstance where an air-purifying respirator may not provide adequate protection.

9. PHYSICAL and CHEMICAL PROPERTIES

APPEARANCE

A translucent, straw-colored or light yellow liquid

ODOR
A strong, characteristic aromatic hydrocarbon odor. Oxygenated gasoline with MTBE and/or TAME may have a sweet, ether-like odor and is detectable at a lower concentration than non-oxygenated gasoline.

ODOR THRESHOLD

	Odor Detection	Odor Recognition
Non-oxygenated gasoline:	0.5 - 0.6 ppm	0.8 - 1.1 ppm
Gasoline with 15% MTBE:	0.2 - 0.3 ppm	0.4 - 0.7 ppm
Gasoline with 15% TAME:	0.1 ppm	0.2 ppm

BASIC PHYSICAL PROPERTIES

BOILING RANGE:	85 to 437 °F (39 to 200 °C)
VAPOR PRESSURE:	6.4 - 15 RVP @ 100 °F (38 °C) (275-475 mm Hg @ 68 °F (20 °C)
VAPOR DENSITY (air = 1):	AP 3 to 4
SPECIFIC GRAVITY (H_2O = 1):	0.70 – 0.78
EVAPORATION RATE:	10-11 (n-butyl acetate = 1)
PERCENT VOLATILES:	100 %
SOLUBILITY (H_2O):	Non-oxygenated gasoline - negligible (< 0.1% @ 77 °F). Gasoline with 15% MTBE - slight (0.1 - 3% @ 77 °F); ethanol is readily soluble in water

10. STABILITY and REACTIVITY)

STABILITY: Stable. Hazardous polymerization will not occur.

CONDITIONS TO AVOID
Avoid high temperatures, open flames, sparks, welding, smoking and other ignition sources

INCOMPATIBLE MATERIALS
Keep away from strong oxidizers.

HAZARDOUS DECOMPOSITION PRODUCTS
Carbon monoxide, carbon dioxide and non-combusted hydrocarbons (smoke). Contact with nitric and sulfuric acids will form nitrocresols that can decompose violently.

11. TOXICOLOGICAL PROPERTIES

ACUTE TOXICITY
Acute Dermal LD50 (rabbits): > 5 ml/kg
Acute Oral LD50 (rat): 18.75 ml/kg
Primary dermal irritation (rabbits): slightly irritating
Draize eye irritation (rabbits): non-irritating
Guinea pig sensitization: negative

CHRONIC EFFECTS AND CARCINOGENICITY
Carcinogenicity:OSHA: NO IARC: YES - 2B NTP: NO ACGIH: YES (A3)

IARC has determined that gasoline and gasoline exhaust are possibly carcinogenic in humans. Inhalation exposure to completely vaporized unleaded gasoline caused kidney cancers in male rats and liver tumors in female mice. The U.S. EPA has determined that the male kidney tumors are species-specific and are irrelevant for human health risk assessment. The significance of the tumors seen in female mice is not known. Exposure to light hydrocarbons in the same boiling range as this product has been associated in animal studies with effects to the central and peripheral nervous systems, liver, and kidneys. The significance of these animal models to predict similar human response to gasoline is uncertain.

This product contains benzene. Human health studies indicate that prolonged and/or repeated overexposure to benzene may cause damage to the blood-forming system (particularly bone marrow), and serious blood disorders such as aplastic anemia and leukemia. Benzene is listed as a human carcinogen by the NTP, IARC, OSHA and ACGIH.

This product may contain methyl tertiary butyl ether (MTBE): animal and human health effects studies indicate that MTBE may cause eye, skin, and respiratory tract irritation, central nervous system depression and neurotoxicity. MTBE is classified as an animal carcinogen (A3) by the ACGIH.

12. ECOLOGICAL INFORMATION

Keep out of sewers, drainage areas and waterways. Report spills and releases, as applicable, under Federal and State regulations. If released, oxygenates such as ethers and alcohols will be expected to exhibit fairly high mobility in soil, and therefore may leach into groundwater. The API (www.api.org) provides a number of useful references addressing petroleum and oxygenate contamination of groundwater.

13. DISPOSAL CONSIDERATIONS

Consult federal, state and local waste regulations to determine appropriate disposal options.

14. TRANSPORTATION INFORMATION

DOT PROPER SHIPPING NAME:	Gasoline
DOT HAZARD CLASS and PACKING GROUP:	3, PG II
DOT IDENTIFICATION NUMBER:	UN 1203
DOT SHIPPING LABEL:	FLAMMABLE LIQUID

PLACARD:

15. REGULATORY INFORMATION

U.S. FEDERAL, STATE, and LOCAL REGULATORY INFORMATION

This product and its constituents listed herein are on the EPA TSCA Inventory. Any spill or uncontrolled release of this product, including any substantial threat of release, may be subject to federal, state and/or local reporting requirements. This product and/or its constituents may also be subject to other federal, state, or local regulations; consult those regulations applicable to your facility/operation.

CLEAN WATER ACT (OIL SPILLS)

Any spill or release of this product to "navigable waters" (essentially any surface water, including certain wetlands) or adjoining shorelines sufficient to cause a visible sheen or deposit of a sludge or emulsion must be reported immediately to the National Response Center (1-800-424-8802) as required by U.S. Federal Law. Also contact appropriate state and local regulatory agencies as required.

CERCLA SECTION 103 and SARA SECTION 304 (RELEASE TO THE ENVIRONMENT)

The CERCLA definition of hazardous substances contains a "petroleum exclusion" clause which exempts crude oil, refined, and unrefined petroleum products and any indigenous components of such. However, other federal reporting requirements (e.g., SARA Section 304 as well as the Clean Water Act if the spill occurs on navigable waters) may still apply.

SARA SECTION 311/312 - HAZARD CLASSES

ACUTE HEALTH	CHRONIC HEALTH	FIRE	SUDDEN RELEASE OF PRESSURE	REACTIVE
X	X	X	--	--

SARA SECTION 313 - SUPPLIER NOTIFICATION

This product contains the following toxic chemicals subject to the reporting requirements of section 313 of the Emergency Planning and Community Right-To-Know Act (EPCRA) of 1986 and of 40 CFR 372:

INGREDIENT NAME (CAS NUMBER)	CONCENTRATION WT. PERCENT
Benzene (71-43-2)	0.1 to 4.9 (0.1 to 1.3 for reformulated gasoline)
Ethyl benzene (100-41-4)	< 3

n-Hexane (110-54-3)	0.5 to 4
Methyl-tertiary butyl ether (MTBE) (1634-04-4)	0 to 15.0
Toluene (108-88-3)	1 to 15
1,2,4- Trimethylbenzene (95-63-6)	< 6
Xylene, mixed isomers (1330-20-7)	1 to 15

US EPA guidance documents (www.epa.gov/tri) for reporting Persistent Bioaccumulating Toxics (PBTs) indicate this product may contain the following deminimis levels of toxic chemicals subject to Section 313 reporting:

INGREDIENT NAME (CAS NUMBER)	CONCENTRATION - Parts per million (ppm) by weight
Polycyclic aromatic compounds (PACs)	17
Benzo (g,h,i) perylene (191-24-2)	2.55
Lead (7439-92-1)	0.079

CALIFORNIA PROPOSITION 65 LIST OF CHEMICALS

This product contains the following chemicals that are included on the Proposition 65 "List of Chemicals" required by the California Safe Drinking Water and Toxic Enforcement Act of 1986:

INGREDIENT NAME (CAS NUMBER)	Date Listed
Benzene	2/27/1987
Ethyl benzene	6/11/2004
Toluene	1/1/1991

CANADIAN REGULATORY INFORMATION (WHMIS)

Class B, Division 2 (Flammable Liquid)
Class D, Division 2A (Very toxic by other means) and Class D, Division 2B (Toxic by other means)

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Lead	7439-92-1	100

Toxicological Data on Ingredients: Lead LD50: Not available. LC50: Not available.

Section 3: Hazards Identification

Potential Acute Health Effects: Slightly hazardous in case of skin contact (irritant), of eye contact (irritant), of ingestion, of inhalation.

Potential Chronic Health Effects:
Slightly hazardous in case of skin contact (permeator). CARCINOGENIC EFFECTS: Classified A3 (Proven for animal.) by ACGIH, 2B (Possible for human.) by IARC. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Not available. The substance may be toxic to blood, kidneys, central nervous system (CNS). Repeated or prolonged exposure to the substance can produce target organs damage.

Section 4: First Aid Measures

Eye Contact:

Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Get medical attention if irritation occurs.

Skin Contact: Wash with soap and water. Cover the irritated skin with an emollient. Get medical attention if irritation develops.

Serious Skin Contact: Not available.

Inhalation:
If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.

Serious Inhalation: Not available.

Ingestion:
Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. If large quantities of this material are swallowed, call a physician immediately. Loosen tight clothing such as a collar, tie, belt or waistband.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: May be combustible at high temperature.

Auto-Ignition Temperature: Not available.

Flash Points: Not available.

Flammable Limits: Not available.

Products of Combustion: Some metallic oxides.

Fire Hazards in Presence of Various Substances: Non-flammable in presence of open flames and sparks, of shocks, of heat.

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available.

Fire Fighting Media and Instructions:
SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use water spray, fog or foam. Do not use water jet.

Special Remarks on Fire Hazards: When heated to decomposition it emits highly toxic fumes of lead.

Special Remarks on Explosion Hazards: Not available.

Section 6: Accidental Release Measures

Small Spill:
Use appropriate tools to put the spilled solid in a convenient waste disposal container. Finish cleaning by spreading water on the contaminated surface and dispose of according to local and regional authority requirements.

Large Spill:
Use a shovel to put the material into a convenient waste disposal container. Finish cleaning by spreading water on the contaminated surface and allow to evacuate through the sanitary system. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep locked up.. Keep away from heat. Keep away from sources of ignition. Empty containers pose a fire risk, evaporate the residue under a fume hood. Ground all equipment containing material. Do not ingest. Do not breathe dust. Wear suitable

protective clothing. If ingested, seek medical advice immediately and show the container or the label. Keep away from incompatibles such as oxidizing agents.

Storage: Keep container tightly closed. Keep container in a cool, well-ventilated area.

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If user operations generate dust, fume or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit.

Personal Protection: Safety glasses. Lab coat. Dust respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Dust respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
TWA: 0.05 (mg/m3) from ACGIH (TLV) [United States] TWA: 0.05 (mg/m3) from OSHA (PEL) [United States] TWA: 0.03 (mg/m3) from NIOSH [United States] TWA: 0.05 (mg/m3) [Canada]Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Solid. (Metal solid.)

Odor: Not available.

Taste: Not available.

Molecular Weight: 207.21 g/mole

Color: Bluish-white. Silvery. Gray

pH (1% soln/water): Not applicable.

Boiling Point: 1740°C (3164°F)

Melting Point: 327.43°C (621.4°F)

Critical Temperature: Not available.

Specific Gravity: 11.3 (Water = 1)

Vapor Pressure: Not applicable.

Vapor Density: Not available.

Volatility: Not available.

Odor Threshold: Not available.

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties: Not available.

Solubility: Insoluble in cold water.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Incompatible materials, excess heat

Incompatibility with various substances: Reactive with oxidizing agents.

Corrosivity: Non-corrosive in presence of glass.

Special Remarks on Reactivity:
Can react vigorously with oxidizing materials. Incompatible with sodium carbide, chlorine trifluoride, trioxane + hydrogen peroxide, ammonium nitrate, sodium azide, disodium acetylide, sodium acetylide, hot concentrated nitric acid, hot concentrated hydrochloric acid, hot concentrated sulfuric acid, zirconium.

Special Remarks on Corrosivity: Not available.

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Inhalation. Ingestion.

Toxicity to Animals:
LD50: Not available. LC50: Not available.

Chronic Effects on Humans:
CARCINOGENIC EFFECTS: Classified A3 (Proven for animal.) by ACGIH, 2B (Possible for human.) by IARC. May cause damage to the following organs: blood, kidneys, central nervous system (CNS).

Other Toxic Effects on Humans: Slightly hazardous in case of skin contact (irritant), of ingestion, of inhalation.

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans: Not available.

Special Remarks on other Toxic Effects on Humans:
Acute Potential: Skin: Lead metal granules or dust: May cause skin irritation by mechanical action. Lead metal foil, shot or sheets: Not likely to cause skin irritation Eyes: Lead metal granules or dust: Can irritate eyes by mechanical action. Lead metal foil, shot or sheets: No hazard. Will not cause eye irritation. Inhalation: In an industrial setting, exposure to lead mainly occurs from inhalation of dust or fumes. Lead dust or fumes: Can irritate the upper respiratory tract (nose, throat) as well as the bronchi and lungsby mechanical action. Lead dust can be absorbed through the respiratory system. However, inhaled lead does not accumulate in the lungs. All of an inhaled dose is eventually abssorbed or transferred to the gastrointestinal tract. Inhalation effects of exposure to fumes or dust of inorganic lead may not develop quickly. Symptoms may include metallic taste, chest pain, decreased physical fitness, fatigue, sleep disturbance, headache, irritability, reduces memory, mood and personality changes, aching bones and muscles, constipation, abdominal pains, decreasing appetite. Inhalation of large amounts may lead to ataxia, deliriuim, convulsions/seizures, coma, and death. Lead metal foil, shot, or sheets: Not an inhalation hazard unless metal is heated. If metal is heated, fumes will be released. Inhalation of these fumes may cause "fume metal fever", which is characterized by flu-like symptoms. Symptoms may include metallic taste, fever, nausea, vomiting, chills, cough, weakness, chest pain, generalized muscle pain/aches, and increased white blood cell count. Ingestion: Lead metal granules or dust: The symptoms of lead poisoning include abdominal pain or cramps (lead cholic), spasms, nausea, vomiting, headache, muscle weakness, hallucinations, distorted perceptions, "lead line" on the gums, metallic taste, loss of appetite, insomnia, dizziness and other symptoms similar to that of inhalation. Acute poisoning may result in high lead levels in the blood and urine, shock, coma and death in extreme cases. Lead metal foil, shot or sheets: Not an ingestion hazard for usual industrial handling.

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are less toxic than the product itself.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:
Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: Not a DOT controlled material (United States).

Identification: Not applicable.

Special Provisions for Transport: Not applicable.

Section 15: Other Regulatory Information

Federal and State Regulations:
California prop. 65: This product contains the following ingredients for which the State of California has found to cause cancer, birth defects or other reproductive harm, which would require a warning under the statute: Lead California prop. 65: This product contains the following ingredients for which the State of California has found to cause reproductive harm (female) which would require a warning under the statute: Lead California prop. 65: This product contains the following ingredients for which the State of California has found to cause reproductive harm (male) which would require a warning under the statute: Lead California prop. 65 (no significant risk level): Lead: 0.0005 mg/day (value) California prop. 65: This product contains the following ingredients for which the State of California has found to cause birth defects which would require a warning under the statute: Lead California prop. 65: This product contains the following ingredients for which the State of California has found to cause cancer which would require a warning under the statute: Lead Connecticut hazardous material survey.: Lead Illinois toxic substances disclosure to employee act: Lead Illinois chemical safety act: Lead New York release reporting list: Lead Rhode Island RTK hazardous substances: Lead Pennsylvania RTK: Lead

Other Regulations:
OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200). EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada): CLASS D-2A: Material causing other toxic effects (VERY TOXIC).

DSCL (EEC):
R20/22- Harmful by inhalation and if swallowed. R33- Danger of cumulative effects. R61- May cause harm to the unborn child. R62- Possible risk of impaired fertility. S36/37- Wear suitable protective clothing and gloves. S44- If you feel unwell, seek medical advice (show the label when possible). S53- Avoid exposure - obtain special instructions before use.

Material Safety Data Sheet
Methylene chloride MSDS

Section 1: Chemical Product and Company Identification

Product Name: Methylene chloride

Catalog Codes: SLM2398, SLM3772, SLM1297, SLM2677, SLM4054

CAS#: 75-09-2

RTECS: PA8050000

TSCA: TSCA 8(b) inventory: Methylene chloride

CI#: Not available.

Synonym: Dichloromethane

Chemical Name: Methylene Chloride

Chemical Formula: C-H2-Cl2

Contact Information:

Sciencelab.com, Inc.
14025 Smith Rd.
Houston, Texas 77396

US Sales: **1-800-901-7247**
International Sales: **1-281-441-4400**

Order Online: ScienceLab.com

CHEMTREC (24HR Emergency Telephone), call: 1-800-424-9300

International CHEMTREC, call: 1-703-527-3887

For non-emergency assistance, call: 1-281-441-4400

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Methylene chloride	75-09-2	100

Toxicological Data on Ingredients: Methylene chloride: ORAL (LD50): Acute: 1600 mg/kg [Rat].

Section 3: Hazards Identification

Potential Acute Health Effects: Very hazardous in case of eye contact (irritant), of ingestion, of inhalation. Hazardous in case of skin contact (irritant, permeator). Inflammation of the eye is characterized by redness, watering, and itching.

Potential Chronic Health Effects: CARCINOGENIC EFFECTS: Classified + (Proven.) by OSHA. Classified 2B (Possible for human.) by IARC. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Not available. The substance is toxic to lungs, the nervous system, liver, mucous membranes, central nervous system (CNS). Repeated or prolonged exposure to the substance can produce target organs damage.

Section 4: First Aid Measures

Eye Contact: Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Cold water may be used. Get medical attention immediately.

Skin Contact: In case of contact, immediately flush skin with plenty of water. Cover the irritated skin with an emollient. Remove contaminated clothing and shoes. Cold water may be used.Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention.

Serious Skin Contact: Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek immediate medical attention.

Inhalation: If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention if symptoms appear.

Serious Inhalation: Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. Seek medical attention.

Ingestion: Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. If large quantities of this material are swallowed, call a physician immediately. Loosen tight clothing such as a collar, tie, belt or waistband.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: May be combustible at high temperature.

Auto-Ignition Temperature: 556°C (1032.8°F)

Flash Points: Not available.

Flammable Limits: LOWER: 12% UPPER: 19%

Products of Combustion: These products are carbon oxides (CO, CO2), halogenated compounds.

Fire Hazards in Presence of Various Substances: Not available.

Explosion Hazards in Presence of Various Substances: Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available.

Fire Fighting Media and Instructions: SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use water spray, fog or foam. Do not use water jet.

Special Remarks on Fire Hazards: Not available.

Special Remarks on Explosion Hazards: Not available.

Section 6: Accidental Release Measures

Small Spill: Dilute with water and mop up, or absorb with an inert dry material and place in an appropriate waste disposal container.

Large Spill: Absorb with an inert material and put the spilled material in an appropriate waste disposal. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions: Keep locked up.. Keep away from heat. Keep away from sources of ignition. Empty containers pose a fire risk, evaporate the residue under a fume hood. Ground all equipment containing material. Do not ingest. Do not breathe gas/ fumes/ vapor/spray. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes.

Storage: Keep container tightly closed. Keep container in a cool, well-ventilated area.

Section 8: Exposure Controls/Personal Protection

Engineering Controls: Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.

Personal Protection: Splash goggles. Lab coat. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill: Splash goggles. Full suit. Vapor respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits: TWA: 50 from ACGIH (TLV) [United States] TWA: 174 from ACGIH (TLV) [United States] Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Liquid.

Odor: Not available.

Taste: Not available.

Molecular Weight: 84.93g/mole

Color: Not available.

pH (1% soln/water): Not available.

Boiling Point: 39.75°C (103.5°F)

Melting Point: -96.7°C (-142.1°F)

Critical Temperature: Not available.

Specific Gravity: 1.3266 (Water = 1)

Vapor Pressure: 46.5 kPa (@ 20°C)

Vapor Density: 2.93 (Air = 1)

Volatility: Not available.

Odor Threshold: 214 ppm

Water/Oil Dist. Coeff.: The product is equally soluble in oil and water; log(oil/water) = 0.1

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water, methanol, diethyl ether, n-octanol, acetone.

Solubility: Easily soluble in methanol, diethyl ether, n-octanol, acetone. Partially soluble in cold water.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Not available.

Incompatibility with various substances: Not available.

Corrosivity: Non-corrosive in presence of glass.

Special Remarks on Reactivity: Not available.

Special Remarks on Corrosivity: Not available.

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation. Ingestion.

Toxicity to Animals: WARNING: THE LC50 VALUES HEREUNDER ARE ESTIMATED ON THE BASIS OF A 4-HOUR EXPOSURE. Acute oral toxicity (LD50): 1600 mg/kg [Rat]. Acute toxicity of the vapor (LC50): 52000 1 hours [Rat].

Chronic Effects on Humans: CARCINOGENIC EFFECTS: Classified + (Proven.) by OSHA. Classified 2B (Possible for human.) by IARC. Causes damage to the following organs: lungs, the nervous system, liver, mucous membranes, central nervous system (CNS).

Other Toxic Effects on Humans: Very hazardous in case of ingestion, of inhalation. Hazardous in case of skin contact (irritant, permeator).

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans: Human: passes through the placenta, excreted in maternal milk.

Special Remarks on other Toxic Effects on Humans: Not available.

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation: Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are more toxic.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:

Section 14: Transport Information

DOT Classification: CLASS 6.1: Poisonous material.

Identification: : Dichloromethane UNNA: 1593 PG: III

Special Provisions for Transport: Not available.

Section 15: Other Regulatory Information

Federal and State Regulations: California prop. 65: This product contains the following ingredients for which the State of California has found to cause cancer, birth defects or other reproductive harm, which would require a warning under the statute: Methylene chloride California prop. 65: This product contains the following ingredients for which the State of California has found to cause cancer which would require a warning under the statute: Methylene chloride Pennsylvania

RTK: Methylene chloride Massachusetts RTK: Methylene chloride TSCA 8(b) inventory: Methylene chloride SARA 313 toxic chemical notification and release reporting: Methylene chloride CERCLA: Hazardous substances.: Methylene chloride

Other Regulations: OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200).

Other Classifications:

WHMIS (Canada): CLASS D-1B: Material causing immediate and serious toxic effects (TOXIC). CLASS D-2A: Material causing other toxic effects (VERY TOXIC).

DSCL (EEC): R22- Harmful if swallowed. R38- Irritating to skin. R41- Risk of serious damage to eyes. R45- May cause cancer.

Material Safety Data Sheet
Nickel metal MSDS

Section 1: Chemical Product and Company Identification

Product Name: Nickel metal

Catalog Codes: SLN2296, SLN1342, SLN1954

CAS#: 7440-02-0

RTECS: QR5950000

TSCA: TSCA 8(b) inventory: Nickel metal

CI#: Not applicable.

Synonym: Nickel Metal shot; Nickel metal foil.

Chemical Name: Nickel

Chemical Formula: Ni

Contact Information:

Sciencelab.com, Inc.
14025 Smith Rd.
Houston, Texas 77396

US Sales: **1-800-901-7247**
International Sales: **1-281-441-4400**

CHEMTREC (24HR Emergency Telephone), call: 1-800-424-9300

International CHEMTREC, call: 1-703-527-3887

For non-emergency assistance, call: 1-281-441-4400

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Nickel metal	7440-02-0	100

Toxicological Data on Ingredients: Nickel metal LD50: Not available. LC50: Not available.

Section 3: Hazards Identification

Potential Acute Health Effects:
Hazardous in case of inhalation. Slightly hazardous in case of skin contact (irritant, sensitizer), of eye contact (irritant), of ingestion.

Potential Chronic Health Effects:
Slightly hazardous in case of skin contact (sensitizer), of ingestion, of inhalation (lung sensitizer). CARCINOGENIC EFFECTS: Classified 2B (Possible for human.) by IARC. Classified 2 (Some evidence.) by NTP. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Not available. The substance is toxic to skin. The substance may be toxic to kidneys, lungs, liver, upper respiratory tract. Repeated or prolonged exposure to the substance can produce target organs damage.

Section 4: First Aid Measures

Eye Contact:

Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Get medical attention if irritation occurs.

Skin Contact:
In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Cover the irritated skin with an emollient. Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention.

Serious Skin Contact: Not available.

Inhalation:
If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.

Serious Inhalation: Not available.

Ingestion:
Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. If large quantities of this material are swallowed, call a physician immediately. Loosen tight clothing such as a collar, tie, belt or waistband.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Non-flammable.

Auto-Ignition Temperature: Not applicable.

Flash Points: Not applicable.

Flammable Limits: Not applicable.

Products of Combustion: Not available.

Fire Hazards in Presence of Various Substances: Not applicable.

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available.

Fire Fighting Media and Instructions:
Flammable solid. SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use water spray or fog. Cool containing vessels with water jet in order to prevent pressure build-up, autoignition or explosion.

Special Remarks on Fire Hazards: Material in powder form, capable of creating a dust explosion. This material is flammable in powder form only.

Special Remarks on Explosion Hazards:
Material in powder form, capable of creating a dust explosion. Mixtures containing Potassium Perchlorate with Nickel & Titanium powders & infusorial earth can explode. Adding 2 or 3 drops of approximately 90% peroxyformic acid to powdered nickel will result in explosion. Powdered nickel reacts explosively upon contact with fused ammonium nitrate at temperatures below 200 deg. C.

Section 6: Accidental Release Measures

Small Spill:
